AKVIS

HDRFactory

Brighter Than Reality

CONTENTS

AKVIS HDRFACTORY 8.0 | HIGH DYNAMIC RANGE IMAGES: BRIGHTER THAN REALITY!

AKVIS HDRFactory is a versatile program for **creating HDR images** and making **photo correction**.

High Dynamic Range Imaging is a technique used to produce an image with high dynamic range.

The software makes HDR photos by combining several images of the same object taken with different exposure values.

The result is an expressive contrasting image that reflects reality with a higher level of authenticity than a simple snapshot.

By comparison, the *human eye* discerns many more nuances of color and brightness than any modern camera could record. The HDR technology endeavours to bridge the gap between reality as we see it and its photographic reflection.

The name of the program can be taken literally, as **HDRFactory is a real workshop for the production of fascinating HDR images**.

With the software you can come very close to reality and even go beyond it by creating stylized images with fabulous colors and unique effects.

AKVIS HDRFactory can also imitate the **HDR effect on a single image**, by creating a so-called *pseudo-HDR*.

This technique is useful if you don't have a series of images with different exposures. Just load a single image into AKVIS HDRFactory and admire the effect which goes beyond photo realism and opens the door into the fascinating world of HDR!

The program can also be used for photo correction. You can adjust color saturation and brightness, and bring out the detail in dark and bright areas.

AKVIS HDRFactory brings life and color to your photos!

It's fast and easy to make an ideal **High Dynamic Range photo** in the program: combine images into one HDR image, and if necessary, apply additional correction and effects.

The program offers a number of the ready to use AKVIS presets. You can also create your own presets by saving frequently used settings. This feature optimizes your work and saves you time.

Advanced licenses (*Home Deluxe* and *Business*) offer additional features. They include the **Ghost Removal** tool that helps to repair the so-called "ghosts" that sometimes appear in an HDR image and the **Local Correction** tool which helps to refine the result on certain areas.

AKVIS HDRFactory is available in two versions - as an independent program (*standalone*) and as a *plugin* to a photo editor. The plugin is compatible with AliveColors, Adobe Photoshop, Corel PaintShop Pro, etc. Check the compatibility.

The *standalone* application also lets you use the **Post Processing** settings to adjust brightness, contrast, gamma, and saturation of the image, and the **Crop** tool to improve the composition.

The *plugin* version supports **Batch Processing** with actions (when making an HDR effect on a single image) that lets you automatically process a lot of images.

INSTALLATION ON WINDOWS

Please find instructions below on how to install the AKVIS programs on Windows.

You must have administrator rights to install the program on your computer.

Before installing the AKVIS plugins, please make sure that the image editor where you want to install the plugins, is closed. Or re-run the image editor after the installation of the plugin.

1. Run the setup **exe** file.
2. Select your language and press the **Install** button.
3. To continue the installation process you have to read and accept the **End User License Agreement**.

    Activate the check box **"I accept the terms in the License Agreement"**, and press **Next**.

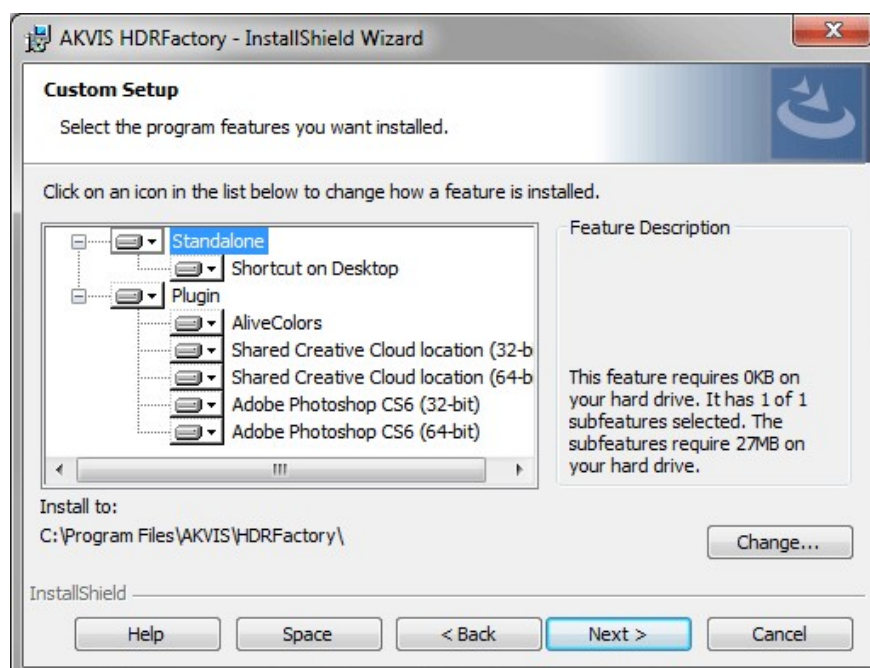

4. To install the **Plugin**, select your photo editor(s) from the list.
    To install the **Standalone** version, make sure that the corresponding option is activated.
    To create a shortcut for the program on desktop, activate **Desktop Shortcut**.
    Press **Next**.

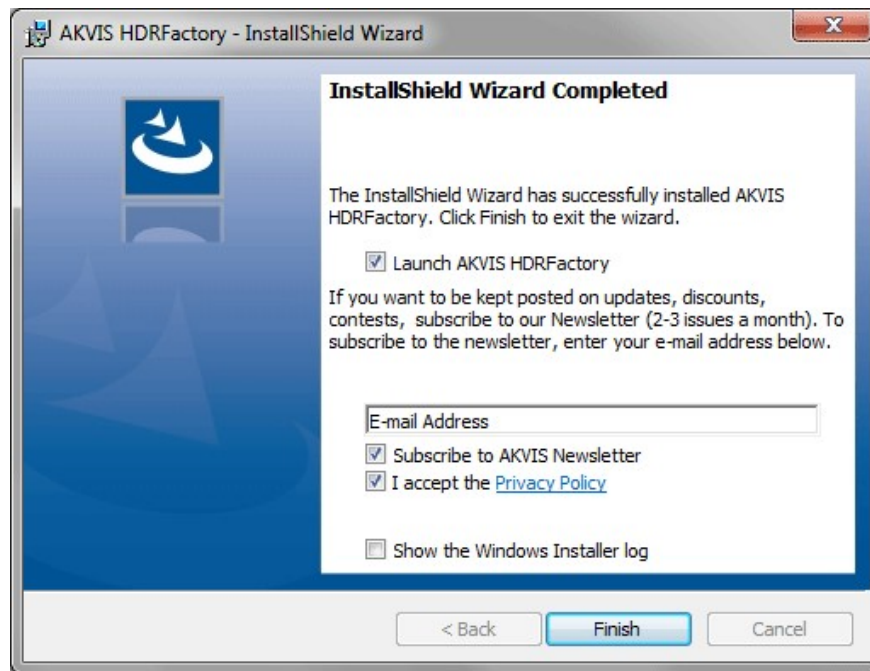

5. Press the **Install** button.

6. The installation is in progress.

7. The installation is completed.

You can subscribe to the **AKVIS Newsletter** to be informed about updates, events, and special offers. Enter your e-mail address and confirm that you accept the Privacy Policy.

8. Press **Finish**.

After installation of the **standalone** version, you will see the program name in the **Start** menu and a shortcut on the desktop, if during installation the corresponding option was enabled.

After installation of the **plugin**, you will see a new item in the **Filter/Effects** menu of your photo editor. For example in **Photoshop**: **Filter -> AKVIS –> HDRFactory**, in **AliveColors**: **Effects -> AKVIS –> HDRFactory**.

INSTALLATION ON MAC

Follow the instructions to install the AKVIS software on a Mac computer.

You must have administrator rights to install the program on your computer.

1. Open the **dmg** file:

   - **akvis-hdrfactory-app.dmg** to install the **Standalone** version

   - **akvis-hdrfactory-plugin.dmg** to install the **Plugin** into your image editor.

2. Read the **License Agreement** and press **Agree**, if you agree with the conditions.

3. **Finder** will open with **AKVIS HDRFactory** application or **AKVIS HDRFactory PlugIn** inside.

4. To install the **Standalone** version, drag the **AKVIS HDRFactory** app into the folder **Applications** (or any other place you like).

   To install the **Plugin**, drag the entire **AKVIS HDRFactory PlugIn** folder into the **Plug-Ins** folder of your graphic editor:

   AliveColors: You can choose in the **Preferences** the folder of the plugins.

   Photoshop CC 2023, CC 2022, CC 2021, CC 2020, CC 2019, CC 2018, CC 2017, CC 2015.5: **Library/Application Support/Adobe/Plug-Ins/CC**;

   Photoshop CC 2015: **Applications/Adobe Photoshop CC 2015/Plug-ins**;

   Photoshop CS6: **Applications/Adobe Photoshop CS6/Plug-ins**.
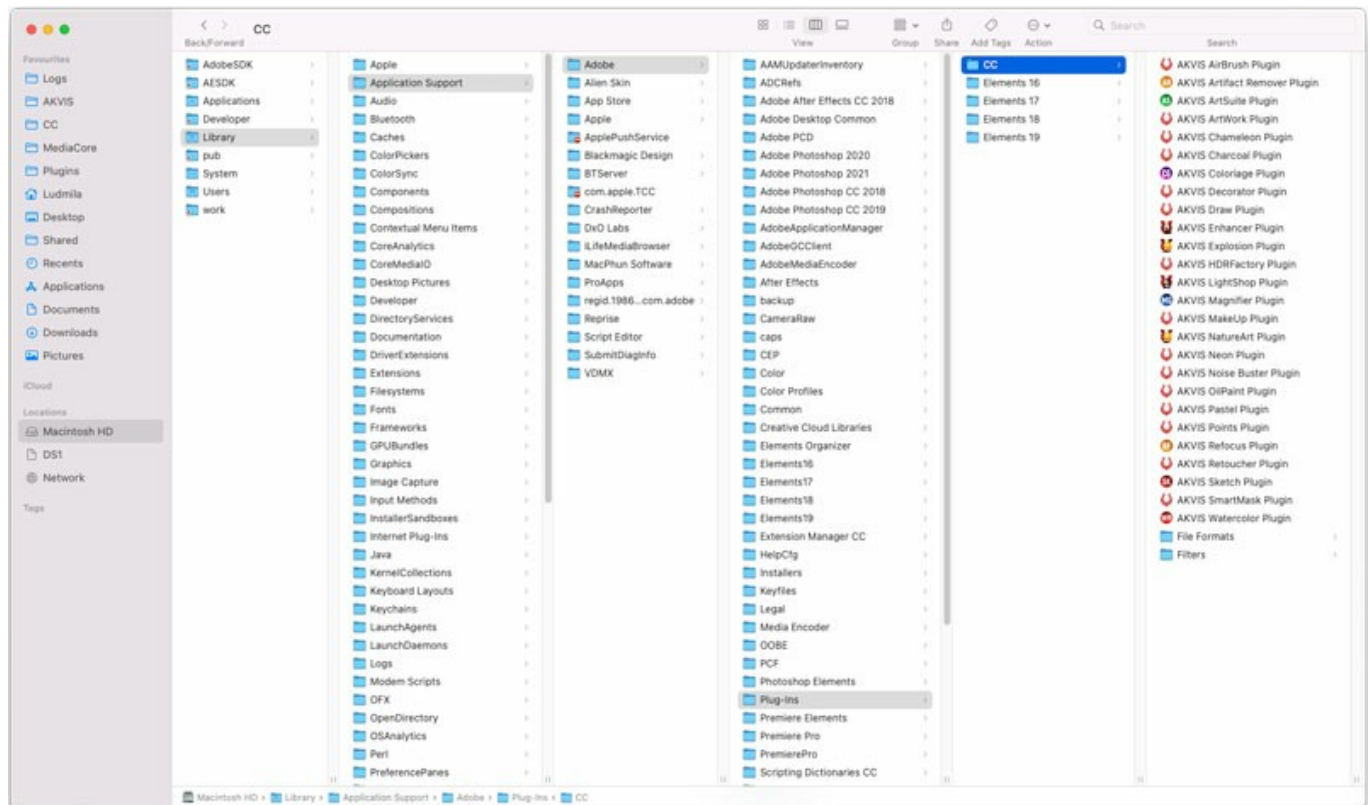

AKVIS Plugins on Mac
(click to enlarge)

After installation of the **plugin**, you will see a new item in the filters/effects menu of your photo editor. Select in **Photoshop**: **Filter -> AKVIS -> HDRFactory**, in **AliveColors**: **Effects -> AKVIS -> HDRFactory**.

Run the **standalone** application by double-clicking on its icon in **Finder**.

You can also run the AKVIS programs from the **Photos** app by choosing the **Image -> Edit With** command (in High Sierra and later versions of macOS).

INSTALLATION ON LINUX

Follow the instructions to install the AKVIS software on a Linux computer.

> **Note:** The AKVIS programs are compatible with **Linux kernel 5.0+ 64-bit**. You can find out the kernel version using the **uname -srm** command.

Installation on **Debian**-based systems:

> **Note:** You need apt-install or apt-get permissions required to install software.

1. Run the terminal.
2. Create a directory to store keys:
   sudo mkdir -p /usr/share/keyrings
3. Download the key that signed the repository:
   curl -fsSL https://akvis.com/akvis.gpg | sudo tee /usr/share/keyrings/akvis.gpg >/dev/null
   or **wget -O - https://akvis.com/akvis.gpg | sudo tee /usr/share/keyrings/akvis.gpg >/dev/null**
4. Add the repository to the list where the system looks for packages to install:
   echo 'deb [arch-=i386 signed-by=/usr/share/keyrings/akvis.gpg] https://akvis-deb.sfo2.cdn.digitaloceanspaces.com akvis non-free' | sudo tee /etc/apt/sources.list.d/akvis.list
5. Update the list of known packages:
   sudo apt-get update
6. Install AKVIS HDRFactory
   sudo apt-get install akvis-hdrfactory
7. The installation is completed.

   Launch the program via the terminal or using the program shortcut.

8. For automatic updates, use the command:
   sudo apt-get upgrade

   To remove the program:
   sudo apt-get remove akvis-hdrfactory --autoremove

Installation on **RPM**-based systems (**CentOS**, **RHEL**, **Fedora**):

1. Run the terminal.
2. Register the key that signed the repository:
   sudo rpm --import https://akvis.com/akvis.asc
3. Add the repository to the system:
   sudo wget -O /etc/yum.repos.d/akvis.repo https://akvis.com/akvis.repo
4. Update the package list:

   when using the **dnf** package manager:
   sudo dnf update

   when using the **yum** package manager:
   sudo yum update

5. Install AKVIS HDRFactory:

   when using the **dnf** package manager:
   sudo dnf install akvis-hdrfactory

   when using the **yum** package manager:
   sudo yum install akvis-hdrfactory

6. The installation is completed.

   Launch the program via the terminal or using the program shortcut.

7. For automatic updates:

   when using the **dnf** package manager:
   sudo dnf upgrade

   when using the **yum** package manager:
   sudo yum upgrade

8. To remove the program:

   when using the **dnf** package manager:
   sudo dnf remove akvis-hdrfactory

   when using the **yum** package manager:
   sudo yum remove akvis-hdrfactory

Installation on **openSUSE**.

1. Run the terminal.
2. Login as a root user.
3. Add the key that signed the repository:
   rpm --import http://akvis.com/akvis.asc
4. Add the repository to the system:
   zypper ar -r https://akvis.com/akvis.repo akvis
5. Update the package list:
   zypper ref
6. Install AKVIS HDRFactory:
   zypper install akvis-hdrfactory
7. The installation is completed.

   Launch the program via the terminal or using the program shortcut.

8. For automatic updates:
   zypper update

   To remove the program:
   zypper remove akvis-hdrfactory

In order to display the program interface correctly, it is recommended to install the Compton or Picom composite manager.

AKVIS SOFTWARE ACTIVATION

Attention! During the activation process your computer must be connected to Internet.

If it is not possible, we offer you an alternative way (see below for Offline Activation).

Download **AKVIS HDRFactory** and install the program. Read the Installation Instruction here.

When you run the unregistered version, a splash window will appear displaying general information about the version and the number of days left in your trial period.

You can also open the **About the Program** window by pressing the button ℹ️ in the program's Control Panel.
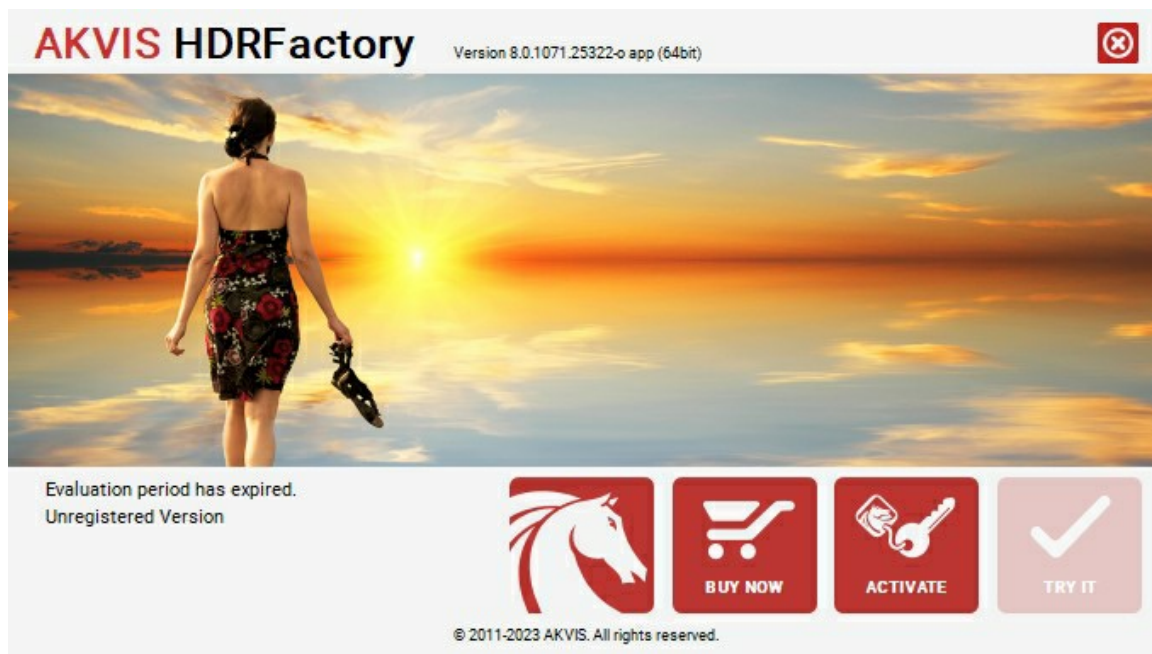

Click on **TRY IT** to evaluate the software. A new window will appear with variants of licenses to test.

You do not need to register the trial version to try all features of the software. Just use the program during the evaluation time (10 days after the 1st start).

During the test period you can try all options and choose the license you like. Select one of the offered functionality types: **Home** (Plugin or Standalone), **Home Deluxe**, or **Business**. Your choice of license will affect which features will be available in the program. Consult the comparison table for more details about license types and versions of the software.

If the trial period has expired, the **TRY IT** button is disabled.

Click on **BUY NOW** to choose a license to order.

When the payment is effected, your serial number for the program will be sent to you within minutes.

Click on **ACTIVATE** to start the activation process.

Enter your name (the program will be registered to this name).

Enter your serial number (your license key).

Choose the method of activation — either direct connection to the activation server or by e-mail.

Direct connection:

We recommend activating the program using direct connection, as it is the easiest way.

At this step your computer must be connected to Internet.

Press **ACTIVATE**.

Your registration is completed!

Request by e-mail:

In case you have chosen activation by e-mail, a message with all necessary information will be created by the program.

NOTE: You can also use this method for **Offline Activation**:

If your computer is not connected to Internet, transfer the activation message to a computer connected to Internet, for example, with a USB stick. Send us this information to: activate@akvis.com.

Please do not send the screenshot! Just copy the text and save it.

We need your serial number for the software, your name, and HardwareID (HWID) of your computer.

We will generate your license file (**HDRFactory.lic**) using this information and will send it to your e-mail address.

Save the .**lic** file (do not open it!) to your computer where you want to register the software, in the **AKVIS** folder in Users' Shared (Public) Documents:

- **Windows**:

  C:\Users\Public\Documents\AKVIS

  (This PC > Local Disk (C:) > Users > Public > Documents > AKVIS)

- **Mac**:

  /Users/Shared/AKVIS

  Open the **Finder**, select the **Go** menu, then select **Go to Folder...** (⌘+Shift+G), type "/Users/Shared/AKVIS", and click **Go**.

- **Linux**:

  /var/lib/AKVIS

Your registration is completed!
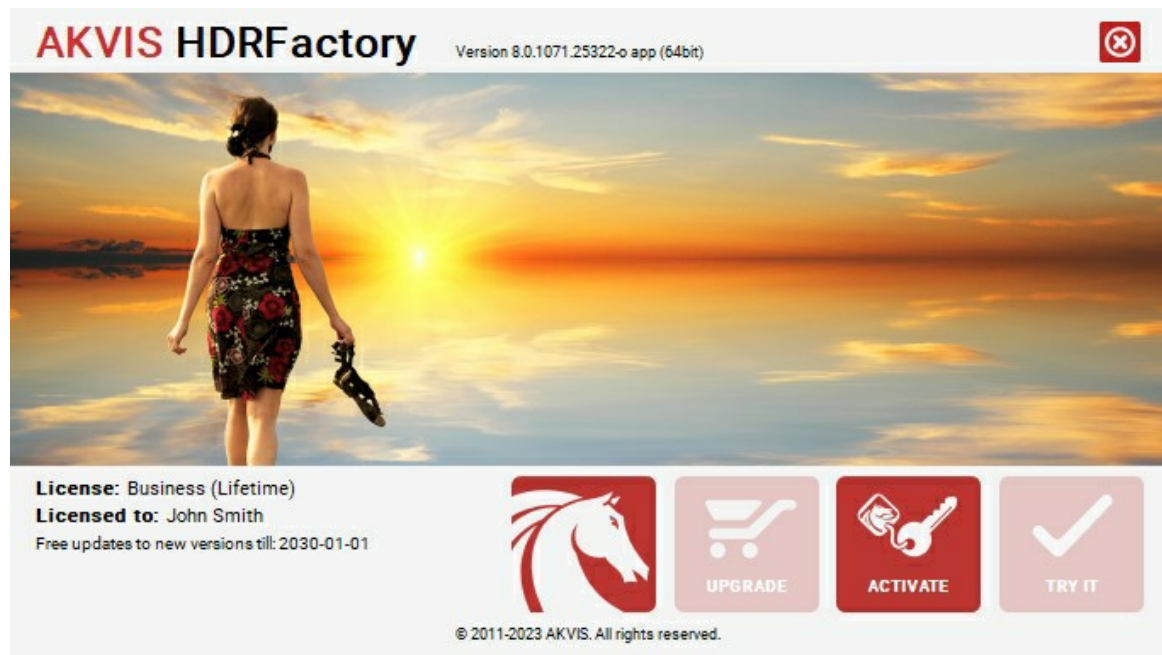

When the program is registered, **BUY NOW** turns to **UPGRADE** that lets you improve your license (for example, change **Home** to **Home Deluxe** or **Business**).

WHAT IS HDRI: ABOUT HIGH DYNAMIC RANGE IMAGING

When you shoot a scene comprising both a strong light source and deep shadows you will notice that details either in shadows or in highlights get lost. Imagine you stay in a dark room and try to take a view outside the window - you will see only one thing in detail - either the view or the room's interior. However, there is a method for keeping detail in every single part of the image.

HDRI (High Dynamic Range Imaging) is a technology that expands the dynamic range of an image and shows details in both shadows and highlights.

Dynamic Range is a range of brightness values that can be recorded on media (film, photographic plate, photographic paper) or on the matrix of a digital camera.

In contrast to the modern cameras that have a low dynamic range, the human eye is able to discern many more tonal values and sees details of any object at any lighting.

HDRI technology minimizes this discrepancy by combining several shots to get an image very close to what the photographer sees with his eyes. However, monitors, just like cameras, have a lower dynamic range and can not render an HDR-image to the best advantage. That is why a technology called **Tone Mapping** is applied to compress the dynamic range of an HDR-image without degrading the image quality. The resulting image is called a LDR (low dynamic range) image, but it looks much better than the original images.

The difference is evident if you take high contrast shots.

Compare the original shots:

And the result of HDRI processing:

Earlier, one had to use gradient filters when shooting or various tools in Adobe Photoshop (masks, layers) to get a similar image.

With the advent of HDRI technology the process has been simplified. Now it is sufficient to take a series of shots of one and the same object using different exposure settings, then load the images into **AKVIS HDRFactory** and combine them into one image.

HOW TO GET SHOTS WITH DIFFERENT EXPOSURES

To generate an HDR-image you need a series of shots of the same scene taken with different exposures. It is possible to use **Manual mode** or **Automatic Bracketing** mode.

Let's look at the second option in detail. Follow the instruction below to take a series of shots with different exposure settings using automatic bracketing:

1. Set your digital camera to automatic bracketing mode (**AEB**). Generally, this mode allows you to take a series of three shots: normal, underexposed and overexposed. Some digital cameras allow you to take a series of 5 and more shots.
2. Set the range of exposures for automatic bracketing. We recommend the following values: **-2, 0,+2**.
3. Set the **ISO** parameter to a value not higher than **100**; otherwise, the shots may have too much noise, which is difficult to handle.
4. Choose the maximum image size.
5. Select a subject for shooting. When shooting outside you can encounter some problems. The scene is rarely static. If there are people and cars moving, wait till they leave the scene. As for leaves trembling in the wind, there is no way to change it and it is not critical - it will not have a considerable impact on the result. If the trees themselves are shaking, it is better to delay shooting the subject, as it may cause the branches to double on the final image.
6. Set the camera on a tripod or on a stable surface. If you fix the camera, shift when shooting will be minimized.
7. Take a series of shots.
8. Transfer the shots to the computer.

Attention! **Do not alter the photos**.

Photos with the exposure settings -2, 0 and 2

WORKSPACE OF THE PROGRAM

AKVIS HDRFactory can work independently as a standalone program or as a plug-in to a photo editor.

Standalone is an independent program. You can run it in the usual way.

Plugin is an add-on for graphics editors, for example for Photoshop, AliveColors, and other compatible programs. To call the plugin, select it from filters of your image editing program.

The **AKVIS HDRFactory** workspace looks like this:

The left part of the program's window is taken by the **Image Window** with two tabs: **Before** and **After**. In the **Before** tab the original image is shown, while in the **After** tab you can see the processed image. You can switch between the windows by clicking on a tab with the left mouse button.

You can select how **Image Window** and **Before/After** tabs will be shown by adjusting the **View Modes** in the bottom part of the left panel.

In the upper part of the program's window you can see the **Control Panel** with the following buttons:

The button opens the home page of **AKVIS HDRFactory**.

The button opens an image or series of shots for processing. The hot-keys for the command are `Ctrl`+`O` on Windows, `⌘`+`O` on Mac.

In the standalone version right mouse click on this button displays the list of recent files (single images or HDR-sets). You can change the number of recent documents in the program's preferences.

The button (only in the standalone version) saves an image to the disk. The hot-keys are `Ctrl`+`S` on Windows, `⌘`+`S` on Mac.

The button (only in the standalone version) opens the print dialog. The hot-keys are `Ctrl`+`P` on Windows, `⌘`+`P` on Mac.

The buttons and (only in the standalone version) let you rotate an image left or right by 90°. The hot-keys are `Ctrl`+`,` (to the left) and `Ctrl`+`.` (to the right) on Windows, `⌘`+`,` and `⌘`+`.` on Mac.

The button (Deluxe/Business) activates the **Ghost Removal** mode.
The button (Deluxe/Business) activates the **Local Correction** mode.

The button / shows/hides the selected areas.

The button cancels the last operation made with the tools. It is possible to cancel several operations in a row. The hotkey for the command is `Ctrl`+`Z` on Windows, `⌘`+`Z` on Mac.

The button returns the last cancelled operation. It is possible to return several operations in a row. The hotkey for the command is `Ctrl`+`Y` on Windows, `⌘`+`Y` on Mac.

Note: The buttons / , are active only when working with selections in the **Ghost Removal** mode or in the **Local Correction** mode.

The button (only in the standalone version) opens the **Batch Processing** dialog to automatically process a series of images.

The button (only in the plugin version) applies the result and closes the plugin.

The button calls information about the program and opens the registration window.

The button calls the **Help** files. The hot-key is `F1`.

The button calls the **Preferences** dialog box for changing the program's options.

The Button opens a window showing the latest news about HDRFactory.

If several images are opened, their thumbnails are shown under the **Image Window**. The **Before** tab displays the image, which is now selected (highlighted in blue). To display a different image, left-click on its thumbnail.
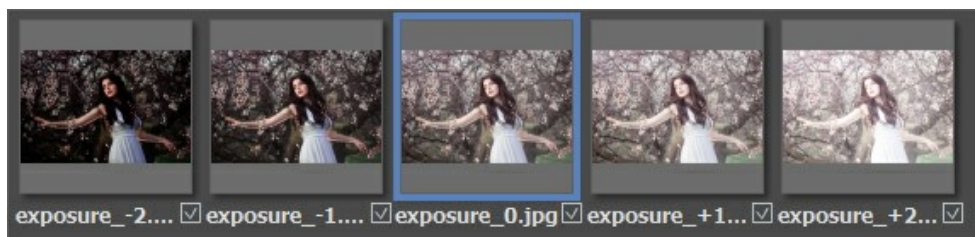

The check-box near the thumbnail indicates if the image will be used when generating the HDR-image. Deactivate the check-box near the image with a left-click, if you do not want to use it when creating the HDR-image.

To the left of the image window there is the **Toolbar**:

Local Correction Tools (available only for Home Deluxe and Business licenses in the *Local Correction* mode):

The button activates the **Pin Tool** that allows you to process certain image areas by adding pins around which the correction area with its parameters is created. The hot-key is `P`.

The button activates the **Correction Area** tool that allows you to mark free-form image areas that require additional processing. To adjust the processing parameters, click the selection with the right mouse button. The hot-key is `B`.

The button activates the **Eraser** tool to edit or remove selections made with . The hot-key is `E`.

Ghost Removal Tools (available only for Home Deluxe and Business licenses when working with a series of pictures in the *Ghost Removal* mode):

The button activates the **Ghost Removal** tool which helps to get rid of defects that sometimes appear in HDR images. Adjust the tool's options in a pop up window which is shown when right-clicking on the image. The hot-key for the tool is `G`.
The button activates the **Eraser** to edit or remove selections made with . The hot-key is `E`.

Additional Tools:

The button (in the standalone program) activates the **Crop** tool for cutting off borders of the image and reducing its size. The hot-key is `Alt`+`C`.

The button activates the **Hand** tool which lets you scroll the image when it does not fit within the window at the desired scale. Bring the cursor over the image, and while keeping the left mouse button pressed move in the desired direction. The hot-key is `H`.
Double-clicking on the tool's icon makes the image fit the window.

The button $\boxed{Q}$ activates the **Zoom** tool which changes the image's scale. To zoom in click on the image. To zoom out click with $\boxed{\texttt{Alt}}$. The hot-key for the tool is $\boxed{\texttt{Z}}$.

Double-clicking on the tool's icon $\boxed{Q}$ makes the image scale to 100% (actual size).
Navigate and scale the image using the **Navigator**. Here you can see the reduced copy of the image. The red frame shows the part of the image that is now visible in the main window; the areas outside the frame will be shaded. Drag the frame to make other parts of the image visible. To move the frame, place the cursor within it, left click the mouse, and then drag.
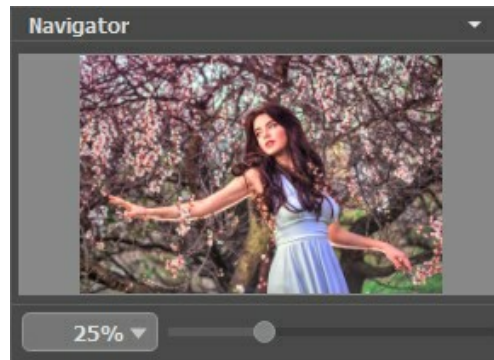

Additionally, you can move the image in the main window with the scroll bars or by holding down the space bar, then holding down the left mouse button while moving the mouse. The mouse's scroll wheel can move the image up and down, and holding $\boxed{\texttt{Ctrl}}$ on Windows, $\boxed{\texttt{⌘}}$ **on Mac – while using the scroll wheel will move the image left and right. Holding** $\boxed{\texttt{Alt}}$ on Windows, $\boxed{\texttt{Option}}$ on Mac will scale the image. Right-click on the scroll bar to activate the quick navigation menu.

Use the slider to scale the image in the window. When you move the slider to the right, the image scale increases. When you move the slider to the left, the image scale reduces.

You can also change the image scale by entering a new coefficient into the scale field and pressing the button $\boxed{\texttt{Enter}}$ on Windows, $\boxed{\texttt{Return}}$ on Mac. Frequently used scale coefficients can be found in a drop-down menu.

You can use hot-keys to change the image scale $\boxed{+}$ and $\boxed{\texttt{Ctrl}}$+$\boxed{+}$ on Windows, $\boxed{\texttt{⌘}}$+$\boxed{+}$ on Mac to increase the image scale and $\boxed{-}$ and $\boxed{\texttt{Ctrl}}$+$\boxed{-}$ on Windows, $\boxed{\texttt{⌘}}$+$\boxed{-}$ on Mac to reduce the scale.

Under the **Navigator** there is the **Settings Panel** where you can adjust parameters.

In the **Presets** field you can save favorite settings as a preset to use them in the future.

The **Hints** field will help you to understand how to use the program. The description for the parameters and buttons appear when you hover over them with the cursor. You can choose where the hints will be shown or hide them in the program's **Preferences**.

IMAGE VIEW MODES: BEFORE AND AFTER

At the bottom of the Toolbar of **AKVIS HDRFactory**, there are three buttons which let you choose how the **Image Window** will look like and arrange the **Before** and **After** tabs.

- Click the first button to open a submenu that contains various options for viewing the original and processed images:

    - The button ⬚ provides the standard image window mode with two tabs: **Before** and **After**.

    - The buttons ⬚⬚ and ⊟ divide the main window into two parts, vertically or horizontally, respectively. The original and processed images become partially visible and the tabs are combined to form the whole picture.
    With this arrangement, it's possible to drag the splitter changing the aspect ratio between the **Before** and **After** parts.

    - The buttons ⬚⬚ and ⊟ split the main window into two parts, vertically or horizontally, as well. However, in contrast to the previous option, the windows display the same fragment of the image before and after processing.

    Note: Use two windows side by side when you want to see and compare the original and processed versions of an image fragment on one screen. If you would rather see the final image as a whole, you can choose the standard image view mode.

- The button ⇄ swaps the positions of the original image and result when displaying two windows.

- The 3rd button lets you choose the background color of the **Image Window**. Pressing ⬜ , ⬛ , or ⬛ changes the background color to white, gray, or black, while clicking on ⬛ opens the **Select Color** dialog where you can choose a color of your choice.

HOW TO USE THE PROGRAM

AKVIS HDRFactory lets you create an **HDR-image** from a series of shots or from one single photo.

Follow the instructions below:

Step 1. Open an image or a series of shots.

- If you work with the standalone edition:

The dialog box **Select Files to Open** appears if you click on the button on the **Control Panel** or using the key combination `Ctrl`+`O` on Windows, `⌘`+`O` on Mac.

The program supports images in the **JPEG**, **TIFF**, **BMP**, **PNG**, **WEBP**, and **RAW** formats (**CRW**, **NEF**, **ORF**, **PEF** etc - see the full list here). You can also drag the required image into the workspace of the program.

- If you work with the plug-in:

Open an image in your photo editor by calling the command **File -> Open**.

Call the **AKVIS HDRFactory** plugin in the Filter/Effects menu of the photo editor:

in **AliveColors**: Effects -> AKVIS -> HDRFactory;
in **Adobe Photoshop:** Filter –> AKVIS –> HDRFactory;
in **Corel Paint Shop Pro:** Effects –> Plugins -> AKVIS –> HDRFactory;
in **Corel Photo-Paint:** Effects -> AKVIS –> HDRFactory.

In plugin as well as in the standalone edition, you can process one single image loaded from the image editor or create an HDR image from the series of shots. To work with **HDRI** tab in the plugin you should open the full set of photos by clicking on .

Step 2. Select the value of the **Preview** parameter.

The **Preview** parameter is an auxiliary tool, it does not influence the real size of the image. The original image will stay the same and all details of the original image will be kept. This parameter speeds up the pre-processing stage when one tries different settings to obtain the best result.

When the **HQ** option is selected, the processing parameters are applied to the image in its original size. The processing time will increase but the preview quality will be as high as possible. If you select the **Fast** option, the preview size is smaller than the original image by 8 times. The processing time will decrease accordingly, but the result will be approximate. For intermediate values, the preview size is 2 and 4 times smaller than the original image.

Attention! Once you have adjusted the parameters, it is recommended to try the **HQ** processing to make sure that the best settings are chosen.

Step 3. When you load a series of images taken with different exposures, the images will be opened to handle in the **HDRI** tab.
Step 4. When a single image is loaded, it will be opened right in the **Adjustment** tab. Here you can make some

correction or create an HDR look with one photo.

Also, here you can continue working with series of shots and apply additional processing to the High Dynamic Range image which you got in 1st tab.

Step 5. Owners of the Home Deluxe and Business licenses can also use the **Ghost Removal** and **Local Correction** modes.

Step 6. Using the **Effects** tab you can add a soft glow effect to the photo, darken or lighten the image edges, adjust image hues, add warm or cold tints.

Step 7. If you like the new settings of the parameters, you can save them as a *preset* and use them later. To save the settings, enter a name for the preset in the **Presets** field and press the button **Save**.

> **Note**: The **HDRI**, **Adjustment**, and **Effects** tabs have the common list of presets. When a new preset is created it will be available in all tabs and will contain all their settings.

When moving a cursor over a preset in the drop-down list, the quick result appears in the **Preset Preview** window.
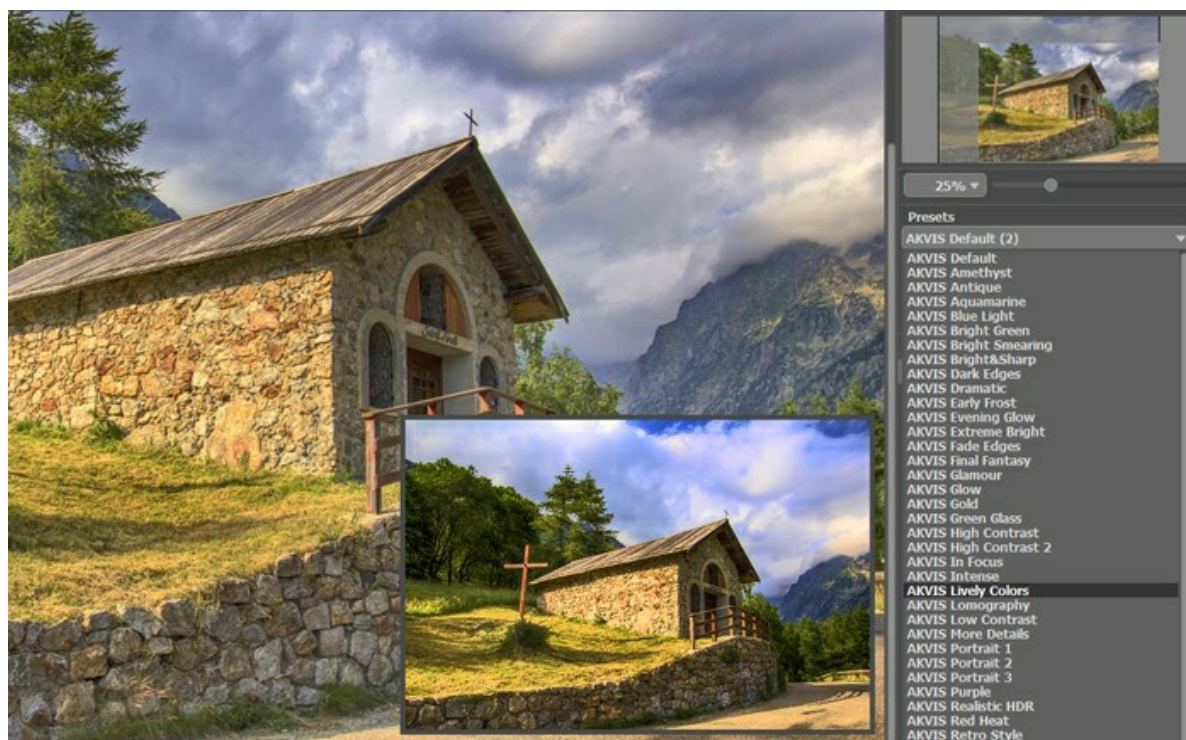

To process the image with a certain preset, select this preset from the list. The image will be automatically processed with the preset's settings.

Next time you launch the program, these settings will be used by default. If you change the parameters you can return to the initial settings of the selected preset by clicking on **Reset**.

To delete a preset, select it from the list and click on the button **Delete**.

Step 8. For further image correction you can use the **Post Processing** settings (only in the standalone version).

Step 9. In the standalone version, you can also print your result using .

Step 10. Save the resulting image.

- If you work with the standalone program:

Click on the button to open the **Save As** dialog box. Enter a name for the file, choose the format (**TIFF**, **BMP**, **JPEG**, **WEBP** or **PNG**) and indicate the target folder.

- If you work with the plugin:

Apply the result by pressing . The **AKVIS HDRFactory** plugin will close and the picture will appear in the photo editor's workspace.

Call the **Save As** dialog box using the command **File -> Save As**, enter a name for the file, choose the format and indicate the target folder.

CREATING HDR IMAGES

This tutorial explains how to use **AKVIS HDRFactory** to obtain an **HDR-image** from a series of shots taken with different exposure settings.

> **Step 1.** Run the standalone edition of **AKVIS HDRFactory** or your photo editor (if you work with the plugin version of **AKVIS HDRFactory**), and open a set of images.
>
> To load a set of images in the plugin or in the standalone program click on [icon] and select all images holding down the Ctrl-key.
>
> Under the image window you can see thumbnails of the opened files. The image which is selected with a blue frame is shown in the **Before** tab.
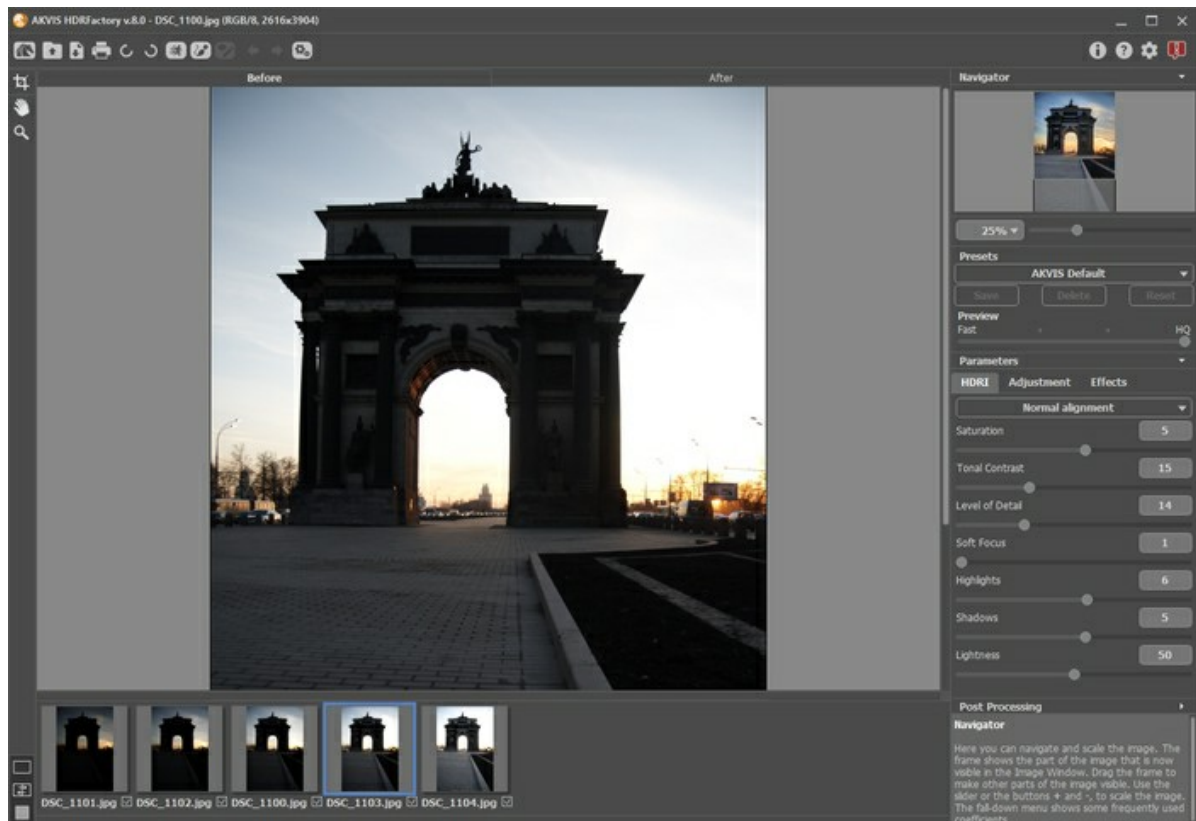

Set of Images

> **Hint**: Learn how to get a series of shots with different exposure settings using a digital camera.
>
> > **Attention!** If the shots do not contain any exposure information you will see the **Set Exposure Value** dialog box (the hot-keys for the command Ctrl+E) where you can enter the values manually.
> >
> > At first the program calculates exposure for every shot automatically; then you can change the values either by selecting the exposure step in the drop-down menu or by entering arbitrary values.
> >
> > > The **Reset** button restores the automatically calculated exposure values.
> > >
> > > The **Apply** button opens the images taking into account the set exposures.
> > >
> > > The **Cancel** button closes the dialog box.

Step 2. The photos will be automatically processed to build an HDR image with the last used parameter values (the first time - with the default values). The result will be shown in the **After** tab.
Step 3. Select the value of the **Preview** parameter. It's an auxiliary tool, it does not influence the real size of the image.
Step 4. Adjust the alignment quality of the images by selecting one of the following options: **Fast alignment**, **Normal alignment** and **High-quality alignment**. The better the alignment quality, the longer the processing time will be. We recommend **Normal alignment**. If you are sure that there is no shift in the image series choose **No alignment**.
Step 5. Select one of the AKVIS presets or adjust the parameters as you like:
> **Saturation** (-50..50). The parameter changes the color intensity of the image.
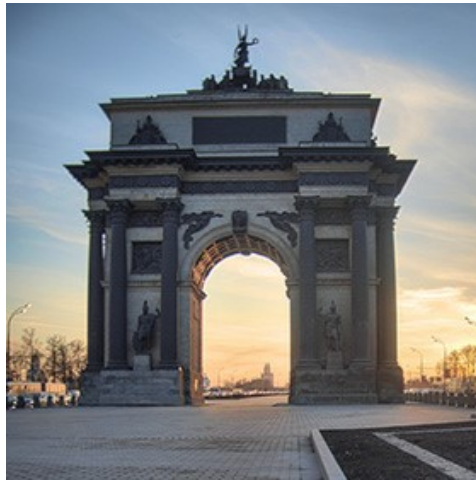

Saturation = -50	Saturation = 50

Tonal Contrast (0-50). The parameter changes brightness in gradient areas.

Tonal Contrast = 5	Tonal Contrast = 50

Level of Detail (0-50). The parameter defines the amount of details. High values may cause noise.
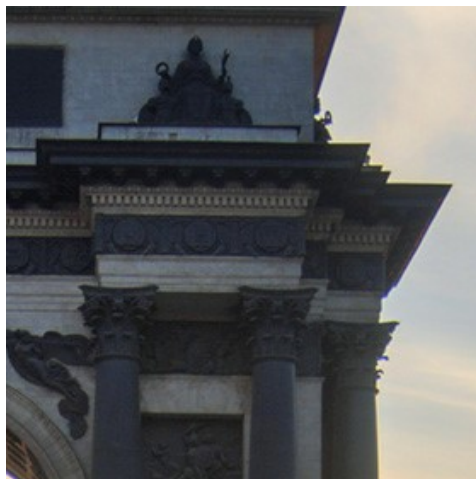

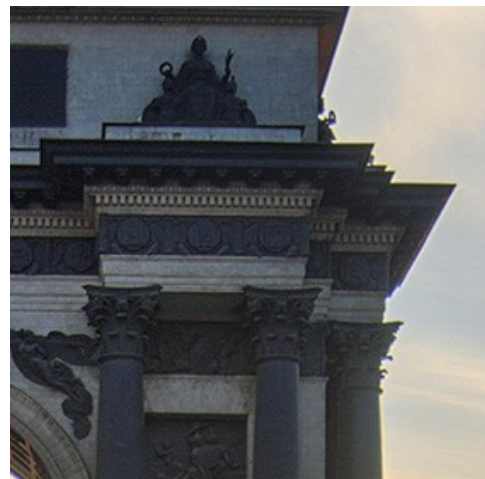

Level of Detail = 10	Level of Detail = 40

Soft Focus (1-15). The parameter aligns the image's color and brightness. It reduces the effect of other parameters.
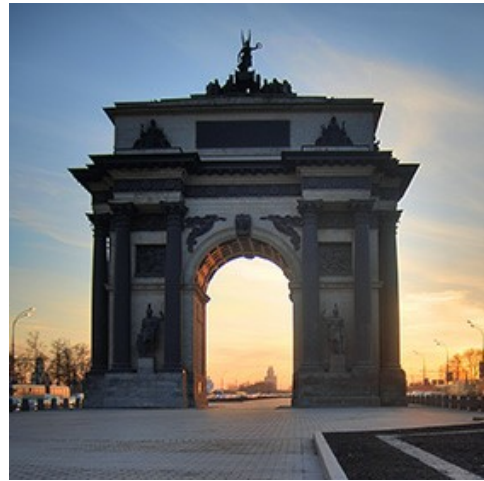

Soft Focus = 1   Soft Focus = 10

Highlights (-50..50). The parameter adjusts the lightness of the light areas of the image. Reduce the value to make the light areas darker, increase to make them lighter.
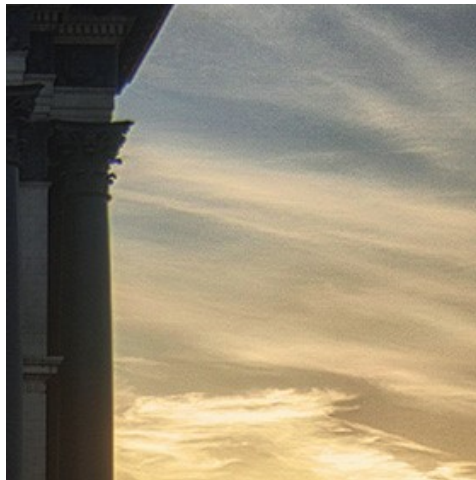

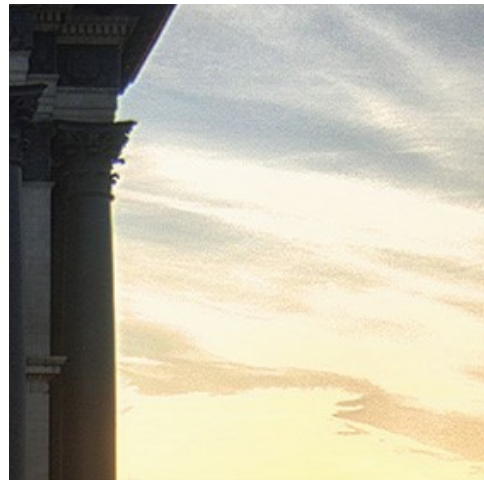

Highlights = -30   Highlights = 30

Shadows (-50..50). The parameter adjusts the lightness of the dark areas of the image. Reduce the value to make the shadows darker, increase to make them lighter.
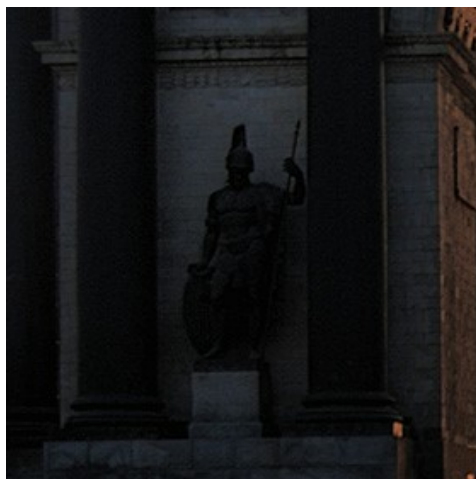

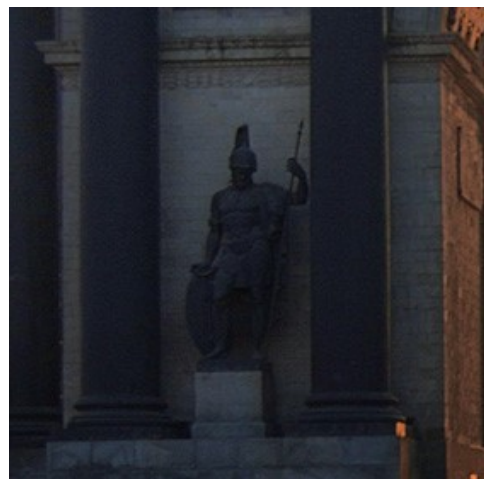

Shadows = -30   Shadows = 30

Lightness (0-100). The parameter changes the overall lightness of the image and helps to illuminate it.

| Lightness = 25 | Lightness = 75 |

Image processing starts automatically and any changes are displayed in real time, in the **After** tab.
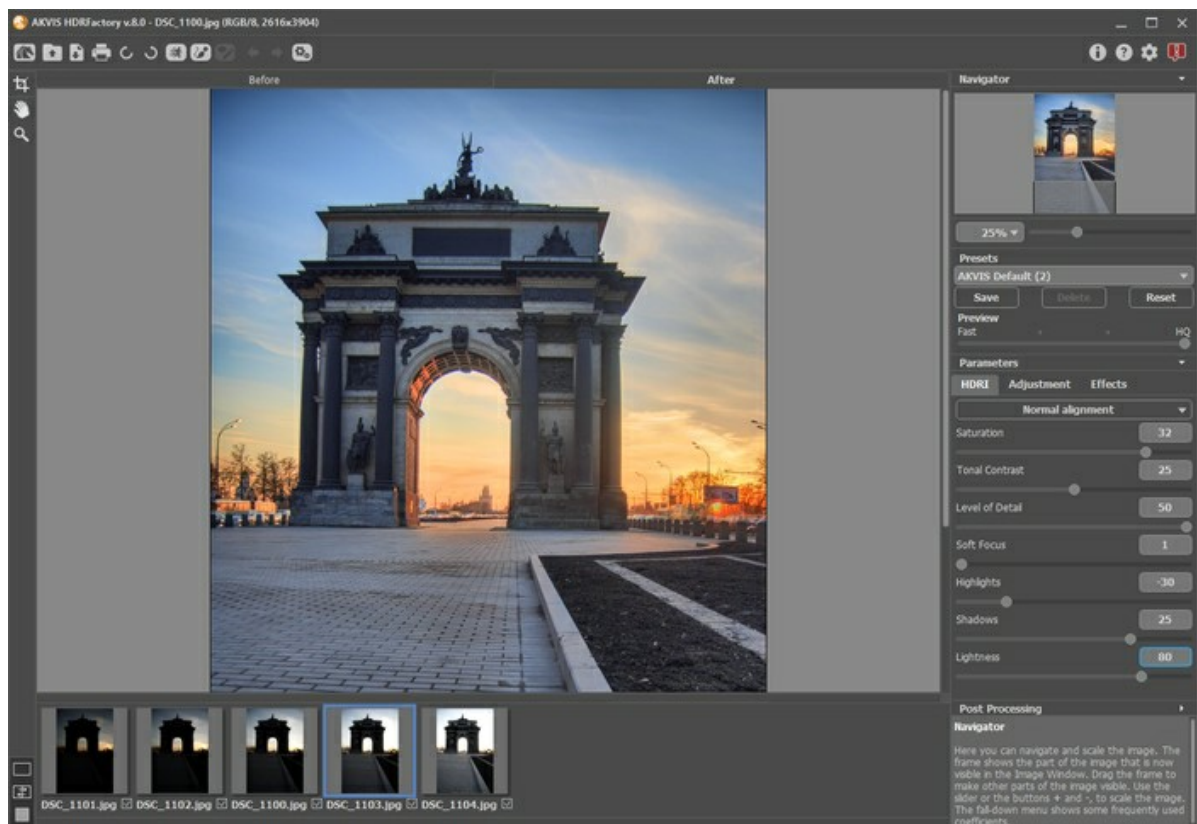

Result

Note: It's possible to apply additional effects to your High Dynamic Range image using the **Adjustment** and **Effects** tabs.

With the Home Deluxe/Business license, you can also use the **Ghost Removal** and **Local Correction** modes.

Step 6. If you like the new settings you can save them as a **preset** and use them later. To save the settings, enter a name for the preset in the **Presets** field and press the button **Save**.

GHOST REMOVAL IN HDR IMAGES

To create an **HDR image**, we need to take a series of photos with different exposures. However, while shooting, especially on a busy street, random objects (cars, people, or animals) can pass through the frame. Their appearance in each photo will be a little different. After the photos are combined, these objects will appear in various places, and due to the transparent nature of these "ghosts", the background will show through them.

Not so long ago, removing these artifacts was a time-consuming procedure. It required a graphics editor and a large amount of time.

Now "ghosts" can be dealt easily with **AKVIS HDRFactory**. Watch a Video Tutorial.

> **Attention!** This feature is only available for the Home Deluxe and Business licenses.

To remove ghosts from the resulting HDR-image follow these steps:

> **Step 1.** Activate the **Ghost Removal** mode and choose the tool .

> **Step 2.** Right-click on the image to access the tool's menu where you can change the tool size and select one of the original images to be used as a source for the problem areas ("ghosts").
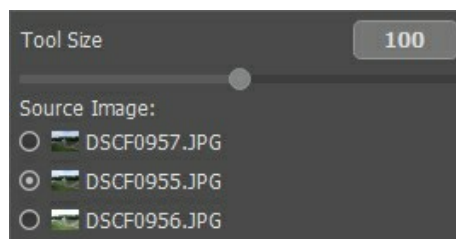

> It's recommended to choose one with the best exposure, where the object is well-visible.

> **Step 3.** Draw over the "ghosts" with . It's better to select an area a bit larger than the defects.

> Note that you can use the tool only on the result in the **After** tab.

> The process starts automatically after using the **Ghost Removal** tool but when the area is highlighted it's hard to see the changes.

> To see the result just hide the selection by clicking on .

If you are not satisfied with the result, you can edit the selection with the **Eraser** ⬜ or choose another source image.

ADJUSTMENT AND SINGLE-SHOT HDR EFFECT

The **Adjustment** tab lets you improve a photo or create an HDR effect from one single image.

We need several photos of one scene, taken at different exposures, to create an HDR image. But sometimes it's impossible (for example, the camera does not have bracketing mode or it's not possible to stabilize the camera). Therefore often there is only one photo, whose details in dark and light areas are hidden. For example, a picture can have a well-defined landscape but a bright, white, featureless sky.

Use the parameters of this tab to reveal details in the darkest and brightest areas, to give an image depth, and increase color saturation. It can help you whether you want to make small corrections or give your image a dramatic HDR look.

Note: When creating a real HDR image from a set of photos in **HDRI** tab, you can use the **Adjustment** tab as the 2nd step, to make additional corrections.

Step 1. The photo will be automatically processed. The result will be shown in the **After** tab.
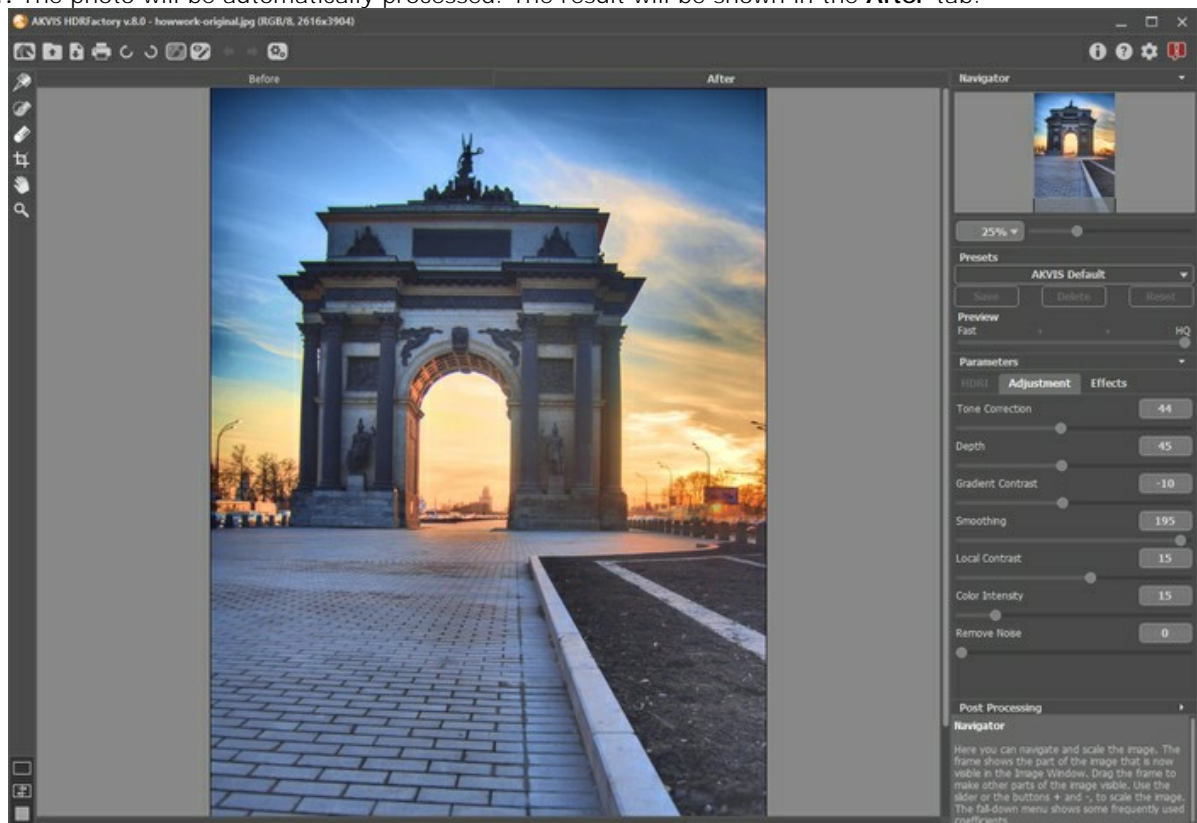

Image Adjustment with Default Settings

Step 2. Select the value of the **Preview** parameter. It's an auxiliary tool, it does not influence the real size of the image. The original image will stay the same and all details of the original image will be kept.

Step 3. You can use one of the standard presets or adjust the settings as you like:

Tone Correction (0-100). The degree of change in the brightness of an image with respect to its surroundings. Dragging the slider to the right increases the impact of this parameter. It can reveal details in overexposed or washed-out areas.
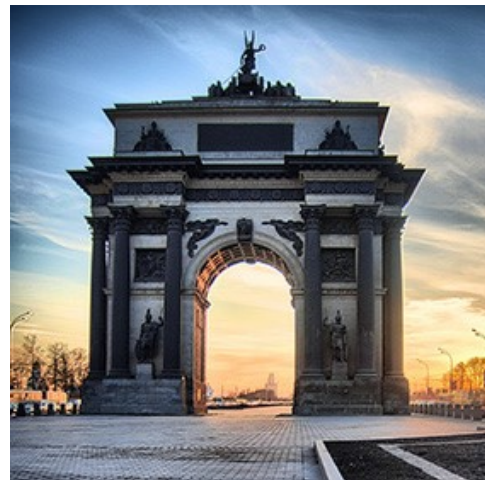

| Tone Correction = 20 | Tone Correction = 70 |

Depth (1-100). This parameter affects the depth of the image. When it is increased the picture becomes more voluminous.

Attention! If **Tone Correction** is 0, changing **Depth** will have no affect on the image.

We recommend you firstly adjust **Tone Correction**, then little by little change **Depth** to get details in both light and darks areas. If you are not satisfied with the result, change the first parameter and then the second one.

| Depth = 1 | Depth = 100 |

36
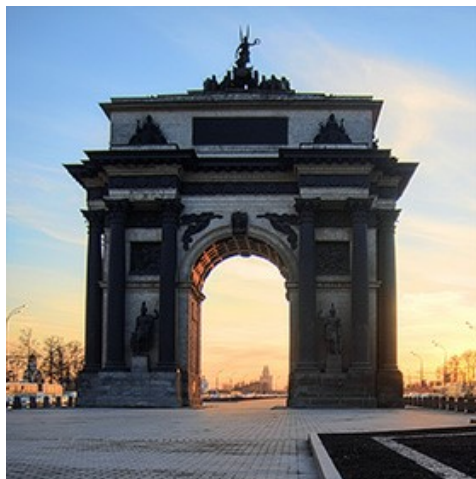

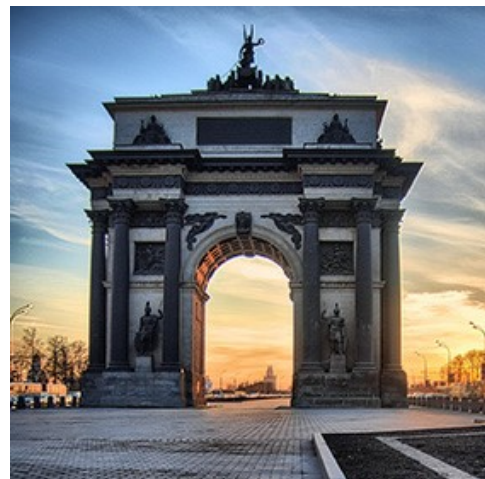

Gradient Contrast (-100..100). This parameter affects contrast in gradient areas. When you move the cursor to the right from 0, the contrast increases, and when to the left, the contrast reduces.

Gradient Contrast = -50   Gradient Contrast = 50

Smoothing (0-200). High values for the first two parameters can reveal noise. This parameter helps to reduce noise while not significantly affecting the clarity of boundaries. If this parameter is set to a high value the image's volume decreases.
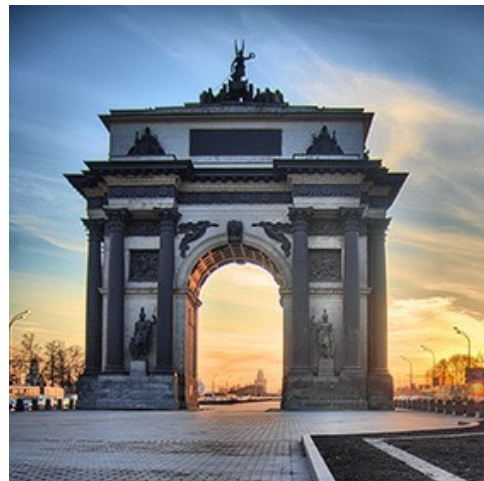

Smoothing = 15   Smoothing = 150

Local Contrast (-100..100). This parameter increases the difference between pixels on the edges of the light and dark areas, it strengthens the details giving them a volume. This local change in contrast mainly affects midtone areas. As this parameter is increased the image becomes sharper.

Local Contrast = -50   Local Contrast = 50

Color Intensity (0-100). Increasing this parameter increases the intensity of all colors in the image. At higher values this may cause noise. If the photo was processed before in other programs, and the original color information was lost, using this parameter could cause an unexpected result. It could, for example, lead to a decrease in the intensity of color in some areas of the picture.
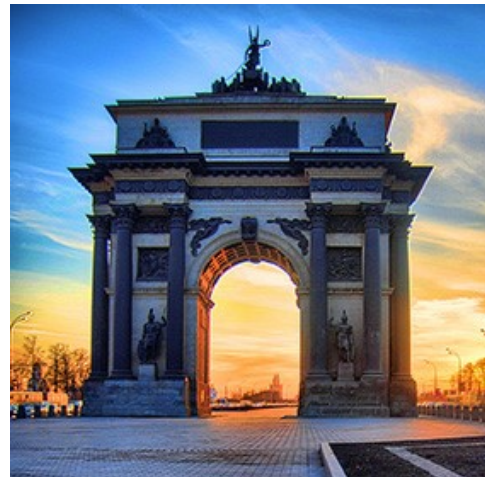

Color Intensity = 10   Color Intensity = 60

Remove Noise (0-25). The parameter lets removing noise and defects by increasing the level of smoothness. The higher the value, the smoother the result is.

Remove Noise = 0   Remove Noise = 10

Image processing will start automatically and any changes will be displayed in real time, in the **After** tab.

Here is the result:
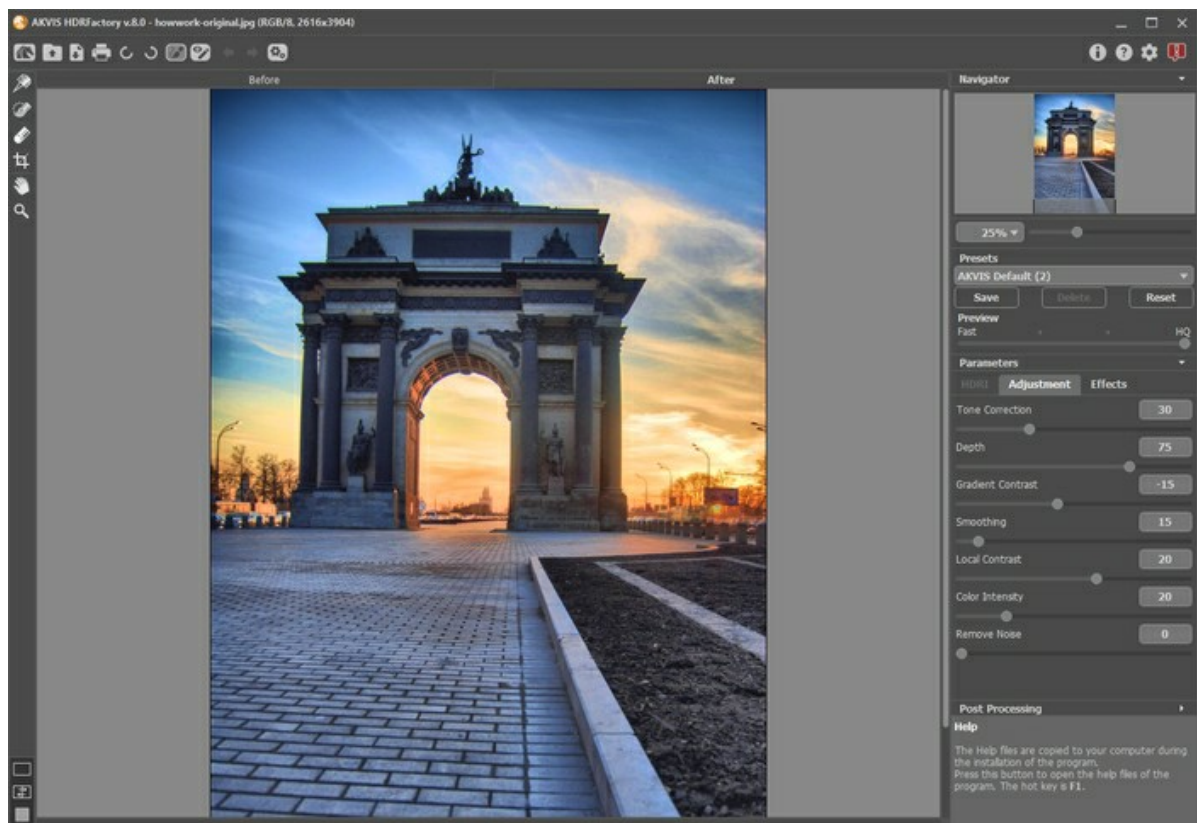

Result

Note: It's possible to apply additional effects to the image using the **Effects** tab.

With the Home Deluxe/Business license, you can also use the **Local Correction** mode to refine the result on certain areas.

Step 4. If you like the new settings you can save them as a **preset** and use them later. To save the settings, enter a name for the preset in the **Presets** field and press the button **Save**.

LOCAL CORRECTION

With the Home Deluxe/Business license, the **Local Correction** mode ![icon] is available. In this mode, you can refine the result on certain image areas.
Original Image   Result

Mark areas that require additional processing using the tools on the **Toolbar**. You can choose between two local correction tools:

Pin Tool ![icon]. The tool allows to perform local correction within an elliptical area. Add pins by clicking on the image with the left mouse button. Adjust the size and shape of the correction area using the following markers:

- **external line** helps to limit the correction area of the selected pin;
- **internal line** determines the smoothness of the transition between the correction area and the non-correction area;
- **dots** are used to rotate, stretch, or compress the correction area.

To move the pin, place the cursor on it (it will turn into crossed arrows ![icon]) and drag holding down the left mouse button. To resize any section, put the cursor on the line bounding this area (it will look like a double arrow ![icon]) and drag with the left mouse button. Right-click on the pin to adjust the correction settings. To remove the pin, press the Delete key.

Correction Area ![icon]. Using the tool, you can mark large areas of arbitrary shape and size. Each area can be processed with its own settings. You can easily edit or remove the selection with the **Eraser** ![icon]. Right-click in the **Image Window** to adjust the tool size. Right-click on the correction area to open a pop-up box with processing parameters.

Use ![icon]/![icon] to show/hide all pins and selections.

To change the processing parameters, call the pop-up box by right-clicking on the pin or selection.

Show Selection. Disable the check-box to hide the selection and view the image.
Exposure (-100..100). If the exposure is too low, the image becomes dark with the lack of details in shadows, if it's too high - the image lightens up with loss of detail in light areas.

Exposure = -50   Exposure = 50

Saturation (-100..100). The parameter changes the color intensity.

Saturation = -50   Saturation = 50

Contrast in Shadows (0-200). The parameter makes dark areas even darker.

Contrast in Shadows = 10   Contrast in Shadows = 100

Contrast in Highlights (0-200). The parameter makes light areas even lighter.

<table>
<tr><td>Contrast in Highlights = 50</td><td>Contrast in Highlights = 150</td></tr>
</table>

Temperature (-100..100). The parameter makes the image colder or warmer. Moving the cursor to the left of 0 increases the number of cool (blue) tones, while moving it to the right of 0 increases the number of warm (yellow) tones.

| Temperature = -50 | Temperature = 50 |

Details (-100..500). Increasing the parameter sharpens the image. If the value is less than 0, the image is blurred.
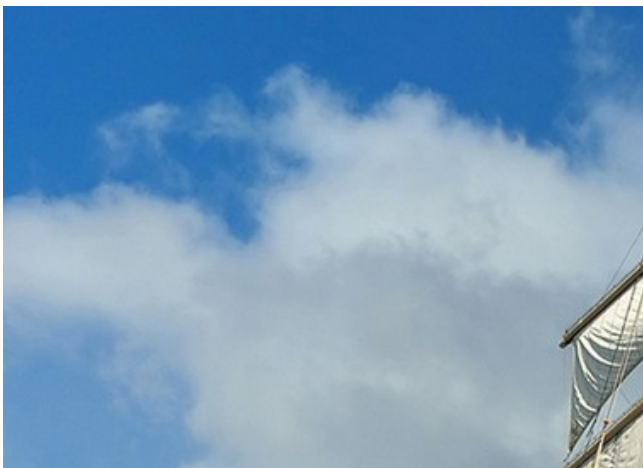

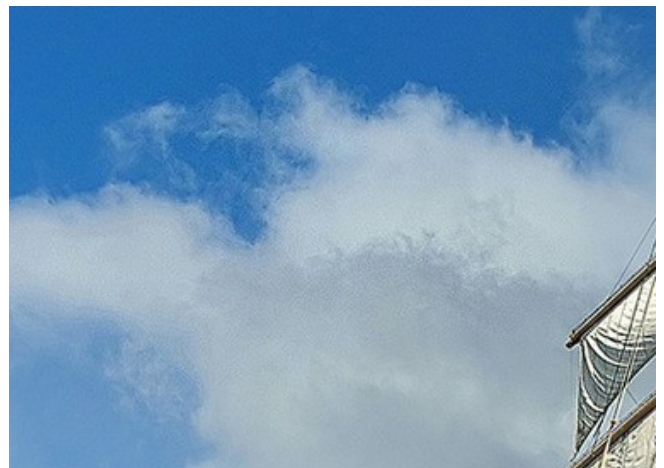

| Details = 0 | Details = 500 |

Threshold (0-100). The parameter determines pixels to be processed.

Threshold = 5   Threshold = 50

Transition (0-100). The parameter creates a smooth transition between adjacent pixels.

Transition = 30   Transition = 80

Radius (0-5000). The parameter lets you increase the processing area spreading the effect beyond the selection.

Radius = 100   Radius = 1000

Any changes of the parameters are applied automatically. Click the **Default** button to return all settings to their default values.

Result

EFFECTS

Using the **Effects** tab you can adjust image hues, add warm or cold tints, apply a soft glow effect, darken or lighten the image edges and highlight the main objects in a scene.

Step 1. The photo will be automatically processed with the last used parameter values. The result will be shown in the **After** tab.

Result With Default Settings

Step 2. Select the value of the **Preview** parameter. It's an auxiliary tool, it does not influence the real size of the image. The original image will stay the same and all details of the original image will be kept.

Step 3. Select one of the AKVIS presets or adjust the parameters as you like:

The parameters under **White Balance** help correct color hues and change the mood of a photo by adjusting its cool or warm tones.

Temperature (-100 to 100) makes the image colder or warmer. Moving the cursor to the left of 0 increases the number of cool (blue) tones, while moving it to the right of 0 increases the number of warm (yellow) tones.

Temperature = -50

Temperature = 50

Tint (-100 to 100) adjusts the tint of the image. The default value is 0. Negative values for this parameter give the image a green hue while positive values add magenta to the image.

Tint = -50

Tint = 50

Glow adds a soft glow effect by creating a blurred layer above the source image. When these layers are blended together it results in a surreal appearance.

Intensity (0-100) defines the strength of the glow effect.

Glow Effect

The parameters under **Vignette** lighten or darken the edges of the photo. This effect helps centrally located objects to be the focus of the image.

Color. Choose the color of the vignette. Adjust the amount of color with the **Intensity** parameter (0-100).

Dark Edges

Light Edges

Distance (0-100) determines how far from the center of the image shading will begin.

<table>
<tr><td>Distance = 5</td><td>Distance = 50</td></tr>
</table>

Shape (-100 to 100) affects the form of the unshaded area of the image. At negatives values it takes the form of a rectangle with rounded edges, while at positive values it takes the form of a circle.

<table>
<tr><td>Shape = -50</td><td>Shape = 50</td></tr>
</table>

Smooth Transition (0-100) adjusts the smoothness of the boundary between the shaded area and the central part. Increasing the value increases the fading effect.

<table>
<tr><td>Smooth Transition = 10</td><td>Smooth Transition = 50</td></tr>
</table>

Position. Move the white marker to shift the vignette. You can see the current coordinates of the center in the X and Y fields.

Moving Vignette

Processing starts immediately after any parameter is adjusted, and any changes are displayed in real time, in the **After** tab.

Here is our result:

Result

Step 4. If you like the new settings you can save them as a **preset** and use them later. To save the settings, enter a name for the preset in the **Presets** field and press the button **Save**.

CROP TOOL

The **Crop** tool allows cutting off unwanted areas in the created HDR image and reducing its size. It lets you improve the composition, align the edges in a crooked photo, make a square from a rectangular or contrariwise.

This tool is available in the *standalone* version of **HDRFactory**. To quickly access it use `Alt`+`C`.
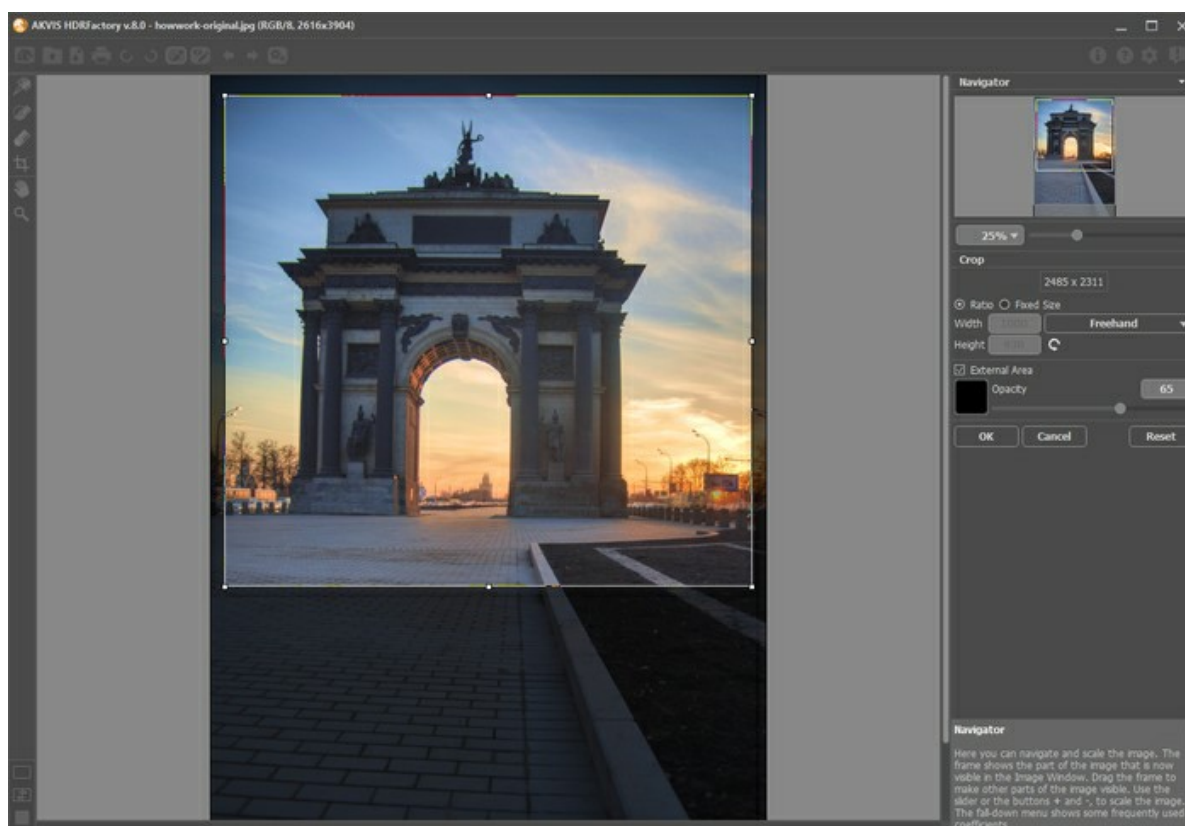

Defining a Crop Area

The rectangular frame shows the image which will be saved as a result. All parts outside of the frame will be cut out. By default, the entire image is selected.

You can change the crop area by dragging the sides and the angles of the bounding frame. To constrain the proportions use the `Shift`-key.

The new image size and the tool's options are displayed in the **Settings Panel**.

> **Note:**
>
> You can't enlarge the image size, only reduce it.
>
> The **Vignette** and other effects will be applied to the new size.

To move the frame, place the cursor ✛ inside it and drag holding down the left mouse button.

To rotate the area, place the cursor ↶ outside the frame, and move it with the left mouse button. If you press `Alt`, the rotation angle will change in 5 degrees.

To apply the result and remove the areas outside the frame, press **OK** in the **Settings Panel** or use `Enter`.

To cancel the operation and exit the tool, press **Cancel** or use the `Esc`-key.

To restore the original area keeping the tool active, press **Reset** button in the **Settings Panel**.

The tool settings are displayed in the **Settings Panel**.

In the drop-down list, select the **Ratio** to which you want to crop the picture. If you would like your image to be cropped to a specific ratio, select the **Custom** option and enter the values in the input fields. Click on to rotate the crop frame by 90°.

Ratio = 1:1   Ratio = 3:4

You can customize the visualization of the removable parts.

If the **External Area** check-box is enabled, the outer parts are highlighted in a selected color.

Check-box is disabled   Check-box is enabled

Adjust the visualization options:

Color. Click on the color square to open the **Select Color** dialog box.

Yellow   White

Opacity (1-100). The parameter defines the transparency of the highlight color.

Opacity = 20   Opacity = 60

POST PROCESSING

For further image correction you can use **Post Processing**. It is available only in the *standalone* edition because any image editor offers these features, so there is no reason to use this section in the plugin.

The panel includes a **Histogram** and four adjustable parameters: **Brightness**, **Contrast**, **Gamma**, and **Saturation**.

A **Histogram** is a graph that shows the tonal range of an image. On the horizontal line the brightness values are set from the darkest to the lightest. The vertical line sets the number of pixels having this lightness value.

Below the histogram there are three sliders that can be moved to change the image contrast.

The extreme point on the right end represents pixels having the maximum brightness (white points). If the histogram does not have such pixels, the image does not contain any white points. If we move the white slider to the left, the point against which the slider is located will assume the maximum brightness (255) and the pixels having this value will become white. The brightness of other pixels will be re-calculated accordingly. The image will get lighter.

The extreme point on the left end represents pixels having the minimum brightness (black points). If the histogram does not start at the left end, the image does not have any black pixels (brightness = 0). If you move the black slider to the right, the point against which the slider is located will assume the minimum brightness value. As a result this tone will become black, while other pixels will be re-calculated accordingly. The image will get darker.

The middle slider defines the tone of the image that will have the brightness of 128 (middle-gray tones). If you move the slider to the left, the mid-gray tones get lighter; if you move the slider to the right, the mid-gray tones get darker.

Near the histogram is a drop-down list with image channels (**RGB**, **Red**, **Green**, **Blue**, **Colors**, **Luminosity**). It is possible to adjust every channel separately or correct a combined channel.

The **Post Processing** panel also contains parameters that correct the brightness and contrast of the image, make gamma-corrections and change the saturation of the image.

   Brightness (-100..100). The parameter is used to change the image brightness. The higher is the value of the parameter, the lighter all pixels are, and vice versa.

   Contrast (-100..100). The parameter is used to increase (if the value is over 0) or reduce (if the value is under 0) the difference between bright and dark parts of the image.

   Gamma (50-250). The parameter is used to change the overall contrast of the image by increasing or reducing mid-

tones and gray mid-tones.

Saturation (-100..100). The parameter is used to change the intensity of colors.

As you adjust the settings, processing is started automatically. The result is shown in the **After** tab.

BATCH PROCESSING

AKVIS HDRFactory supports the **Batch Processing** feature that lets you automatically convert a series of images with the same settings and saves you time and efforts. It is useful when creating a number of illustrations at the same style for a booklet or when processing all frames of video.
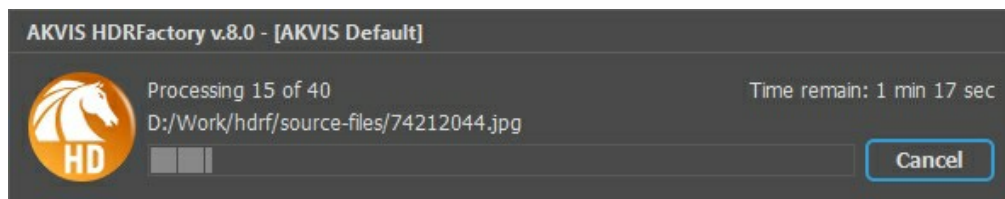

Even if you've never used this feature before it is simple to learn!

If you use the standalone version of **AKVIS HDRFactory**, read the instructions here.

If you use the **HDRFactory** plugin in Photoshop, use this tutorial.

BATCH PROCESSING WITH PHOTOSHOP PLUGIN

The AKVIS plugins support the automation feature in **Adobe Photoshop**.

Batch processing is very useful and time saving when you have to apply the effects to a number of photos. This method applies the same settings to a folder full of images.

Even if you have never used batch processing you will find no difficulties in understanding it. First you create an **Action** in Photoshop and then apply it to a photo folder.

Follow the instructions:

> **Step 1.** Create two new folders, for example: "source-files" and "result-files". Place original images into the "source-files" folder. The results will be saved in the "result-files" folder.
> **Step 2.** Open one of the original images in **Adobe Photoshop**. We will use this photo to adjust the plugin's settings and create an action.

> **Step 3.** In the **Actions** palette click **Create New Set** button. In the dialog window give a name for a new set of actions, for example, "AKVIS".

If you already have a special set for the AKVIS actions, you can just choose it.
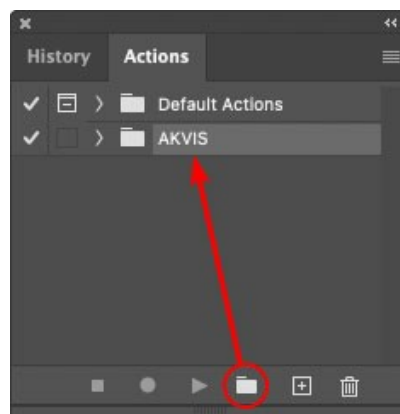

Actions Palette

> **Step 4.** Press **Create New Action** and give a name for it, for example, "Oil".

New Action
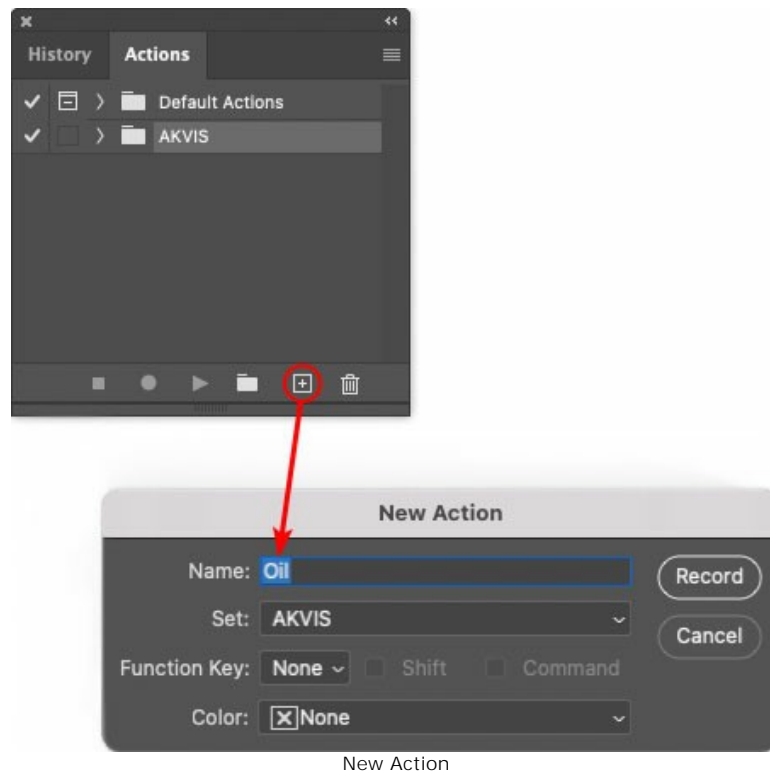

Press the **Record** button, and the recording of the action will immediately start.
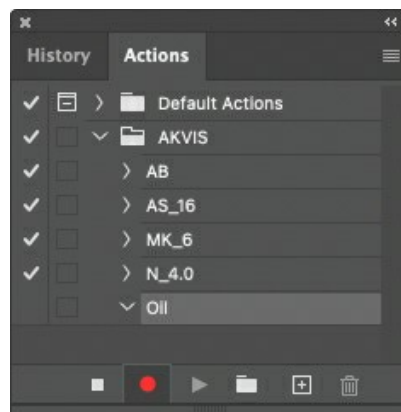

Step 5. Call the plugin and adjust its parameters.
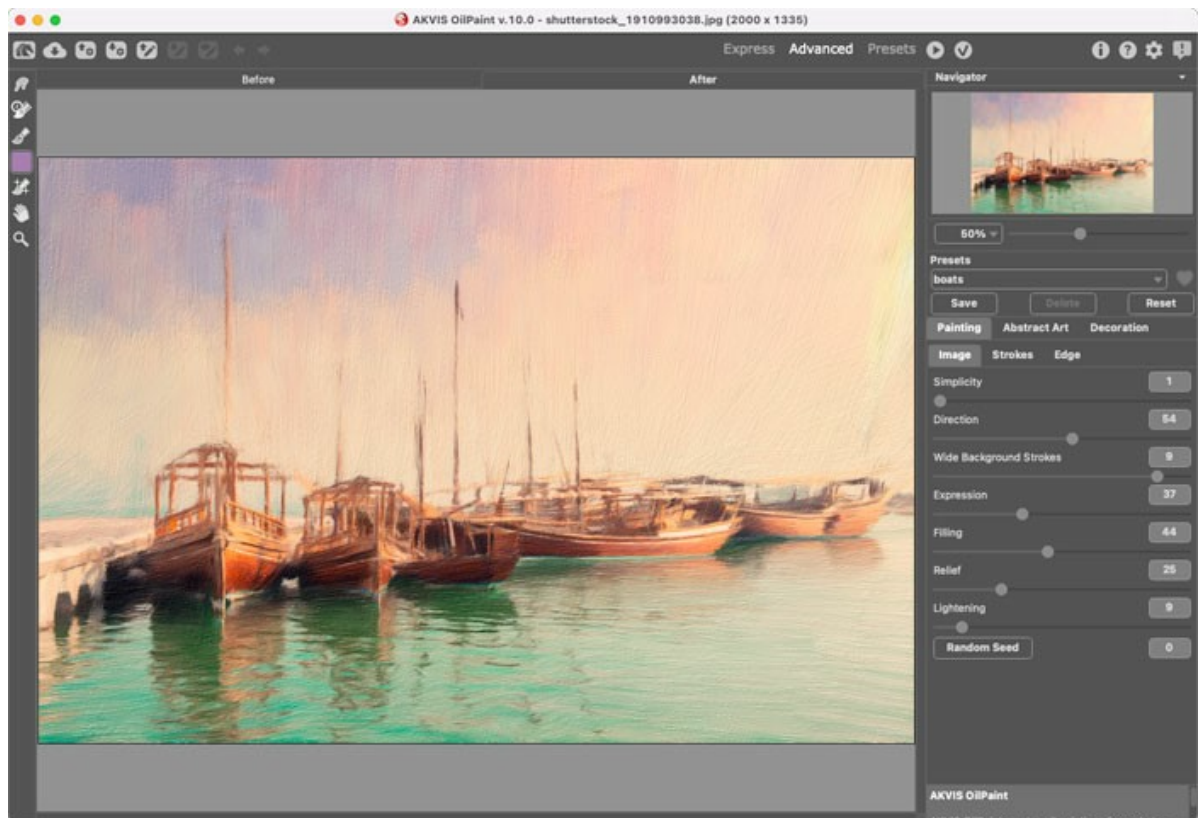

Step 6. Press the button ⊘ . The plug-in window will close and the effect will be applied to the image. In the **Actions** palette, in your new action, you will see a new line with the plugin's name.
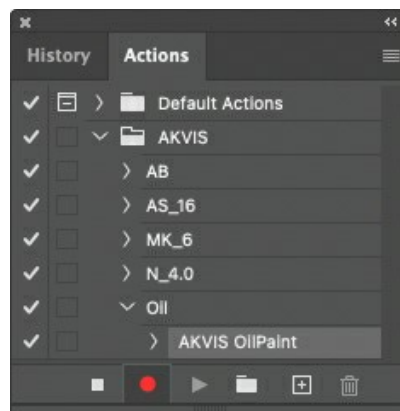

Step 7. Remember that the action is still being recorded. Now, you should save the image. Choose **Save As** in the **File** menu and save the image into the destination folder.
Step 8. Stop the action recording by pressing **Stop playing/recording** at the bottom of the **Actions** palette.
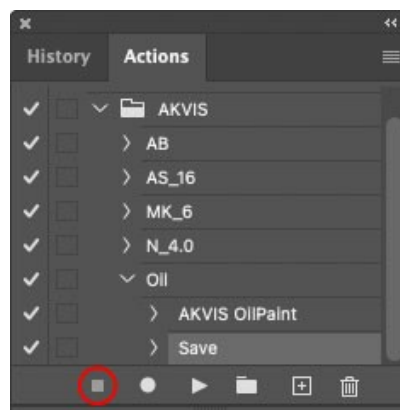

Step 9. Delete the file that you have just saved.
Step 10. The action is created and you can proceed to batch processing of the photos.

In the **File** menu of the editor choose **Automate -> Batch**.

Step 11. In the **Batch** dialog window and set the parameters:
    In the **Set** drop-down list choose "AKVIS" and the new action.
    In the **Source** option set **Folder**. Press the **Choose...** button and select "source-files".
    As the Open command was not recorded in the action, the **Override Action "Open" Commands** check-box should be deactivated.

For **Destination** select **Folder**, then press the **Choose...** button and select "result-files".
Activate **Override Action "Save as" Commands** check-box.
In the **File Naming** section you can create the filenames structure for the resulted images. If you do not want to change the names, in the first combo-box choose **document name**, and in the second - **extension**.
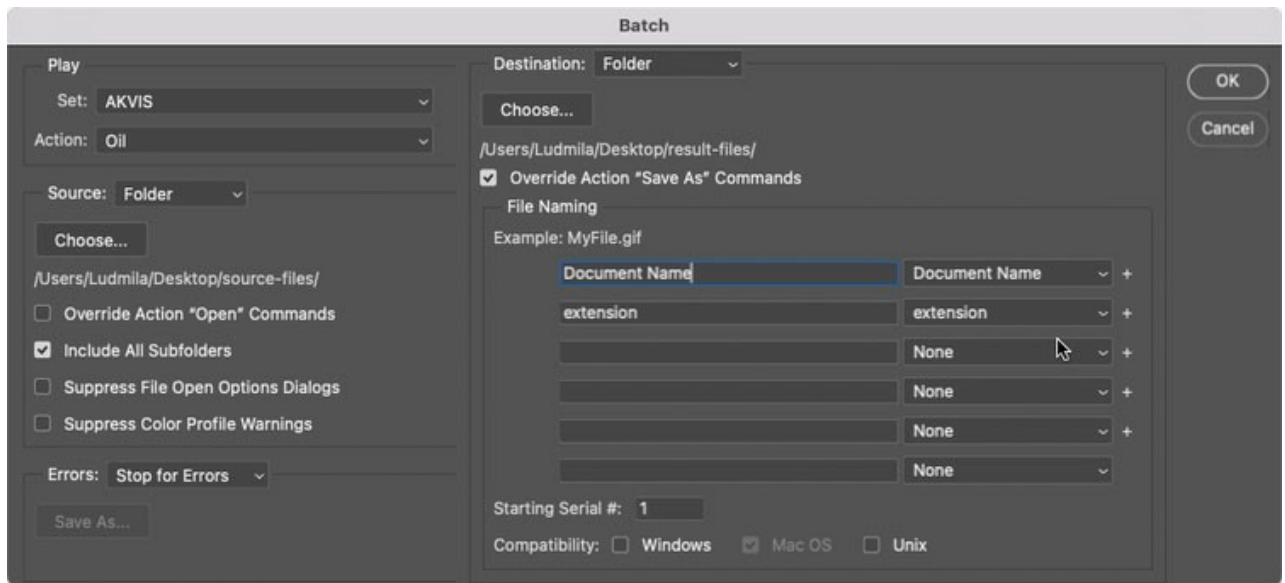

Step 12. Press **OK** to start processing. Photoshop will apply the AKVIS plugin to all photos in the "source-files" folder, one by one, and will save them to the "result-files" folder.

PROGRAM PREFERENCES

The button ⚙ opens the **Preferences** dialog box. It looks like this:
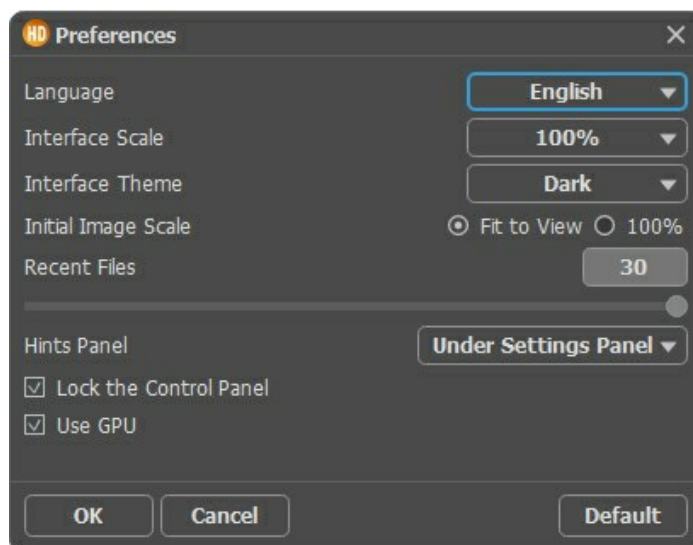

- **Language**. Change the program language by selecting another from the drop-down list.
- **Interface Scale**. Choose the size of the interface elements. When it is set to **Auto**, the program workspace will automatically scale to fit the screen resolution.
- **Interface Theme**. Select the style of the program interface: **Light** or **Dark**.
- **Initial Scale**. This parameter defines the way the image is scaled in the **Image Window** after opening. The parameter can take one of two values:

  - image scaling **Fit to View**. The scale adjusts so that the image will be completely visible in the **Image Window**;
  - if the option **100%** is checked, image doesn't scale. Generally, when the scale = 100%, only part of the image will be visible.

- **Recent Files** (available only in the standalone version). The number of recent documents. The list of the recent files (single images or HDR-sets), sorted by time, become visible by right mouse clicking on ⬆. Maximum: 30 files.

- **Hints Panel**. When you hover over parameters and buttons with the cursor you can see a brief description of them in the **Hints** field. You can choose how the hints will be shown:

  - **Under Settings Panel**. Select this to show hints at the bottom of the right part, under the settings;
  - **Under Image Window**. It shows the hints in the main window, under the image. This mode is useful if there is not enough space by height to display this field under the settings;
 - **Hide**. Use this option if you do not need the hints.

- **Lock the Control Panel** check-box. It disables the possibility to hide/show the top panel. If the check-box is selected the panel is always visible. Uncheck the option to unlock the panel, and you will be able to hide/show it by clicking on the small triangle button (in the middle of the panel). The minimized panel will be shown when moving the cursor over it.
- **Use GPU**. The check-box lets you turn on GPU acceleration. If your computer does not support GPU acceleration the check-box will be disabled.

To save changes made in the **Preferences** window press **OK**.

If you need, click on the button **Default** to come back the default settings.

PRINT IMAGES IN AKVIS HDRFACTORY

In the standalone version of **AKVIS HDRFactory** you can print the image. Press the button 🖶 to open the **Print** options.
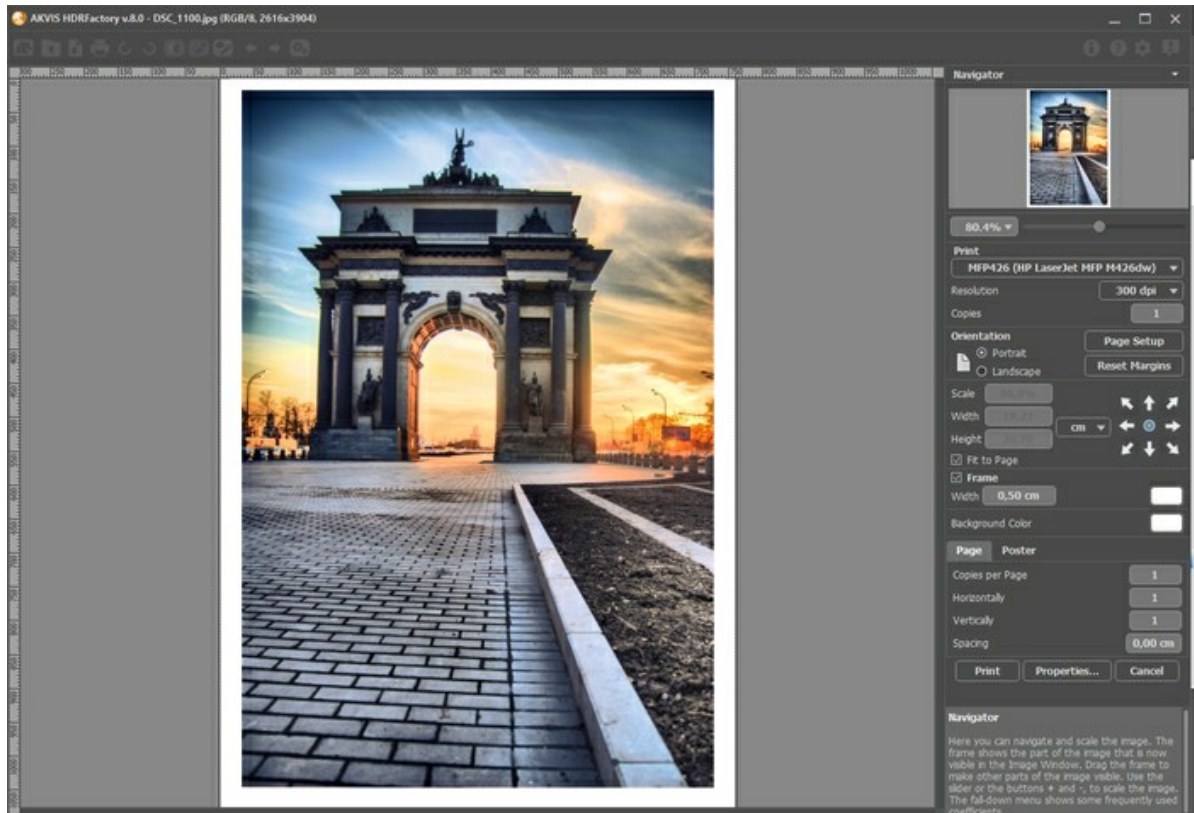

Print Options in AKVIS HDRFactory

Adjust the parameters appearing in the Settings Panel:

Choose a printer from the list of available devices, set the desired resolution, as well as the number of copies to print.

In the **Orientation** group, set the position of paper: **Portrait** (vertically) or **Landscape** (horizontally).

Click the **Page Setup** button to open a dialog box to choose the size of the paper and its orientation, as well as the print margins.

Press the **Reset Margins** button to return the page margins to the default size.

Change the size of the printed image adjusting the parameters **Scale**, **Width**, **Height** and **Fit to Page**. These parameters have no effect on the image itself, just on the print version. You can change the size of the printed image by entering any value in %, or by entering new values in **Width** and **Height**.

To adjust the size of the image to the paper size, select **Fit to Page**.

Move the image on the page with the mouse or align it using the arrow buttons.

You can activate **Frame** for the image and adjust its width and color.

Choose the **Background Color** by clicking on the color plate.

In the **Page** tab, you can adjust printing of the multiple copies of the image on a single sheet.

Print Page

- ○ **Copies per Page**. It lets you specify the number of copies of the image on one page.
- ○ **Horizontally** and **Vertically**. These parameters indicate the number of rows and columns for the copies of the image on the page.
- ○ **Spacing**. The parameter sets the margins between the copies of the image.

In the **Poster** tab, it's possible to customize printing of the image on multiple pages for the subsequent junction into a large picture.

Print Poster

- ○ **Pages**. If the check-box is enabled, you can specify the maximum number of the pages in which the image will be divided. The image scale will be adjusted to fit this number of the sheets. If the check-box is disabled, the program will automatically select the optimal number of the pages in accordance with the actual size of the image (scale = 100%).
- ○ **Glue Margins**. If the check-box is enabled, you can adjust the width of the padding for bonding sheets. Margins will be added to the right and to the bottom of each part.
- ○ **Show Numbers**. With the enabled check-box, a sequence number of each part, by a column and a row, will be printed in the margins.
- ○ **Lines of Cut**. Activate the check-box to display the cut marks in the margins.

To print the image with the chosen parameters, press the **Print** button.
To cancel and close the printing options click on **Cancel**.

Click the **Properties...** button to open a system dialog box that enables you to access the advanced settings and send the document to print.

SUNSET BEACH: CREATING AN HDR EFFECT ON A PHOTO

When photographing a beautiful landscape, you want the picture to be as colorful and realistic as in real life. But usually the result is a huge disappointment. On a monitor, a bright and rich landscape looks washed out and lifeless.

AKVIS HDRFactory can help you turn an ordinary photograph into a fantastically beautiful and vivid picture.

Let's try to give a photograph a HDR look:

> **Step 1.** Start the standalone version of **AKVIS HDRFactory**. We open an image and see a gray sea, gray skies, and a pale strip of sunset.
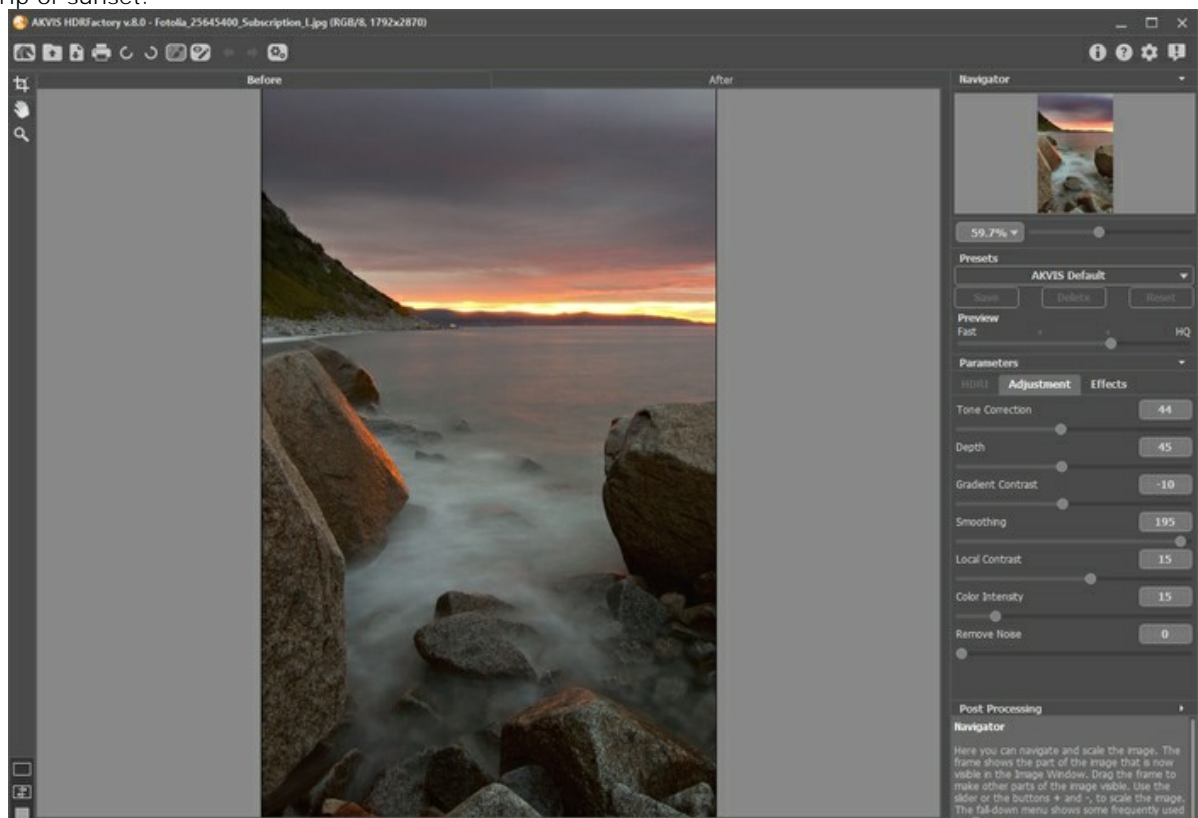

> **Step 2.** After the program has been started the photograph will be processed using the default settings. The result will be shown in the **After** tab.
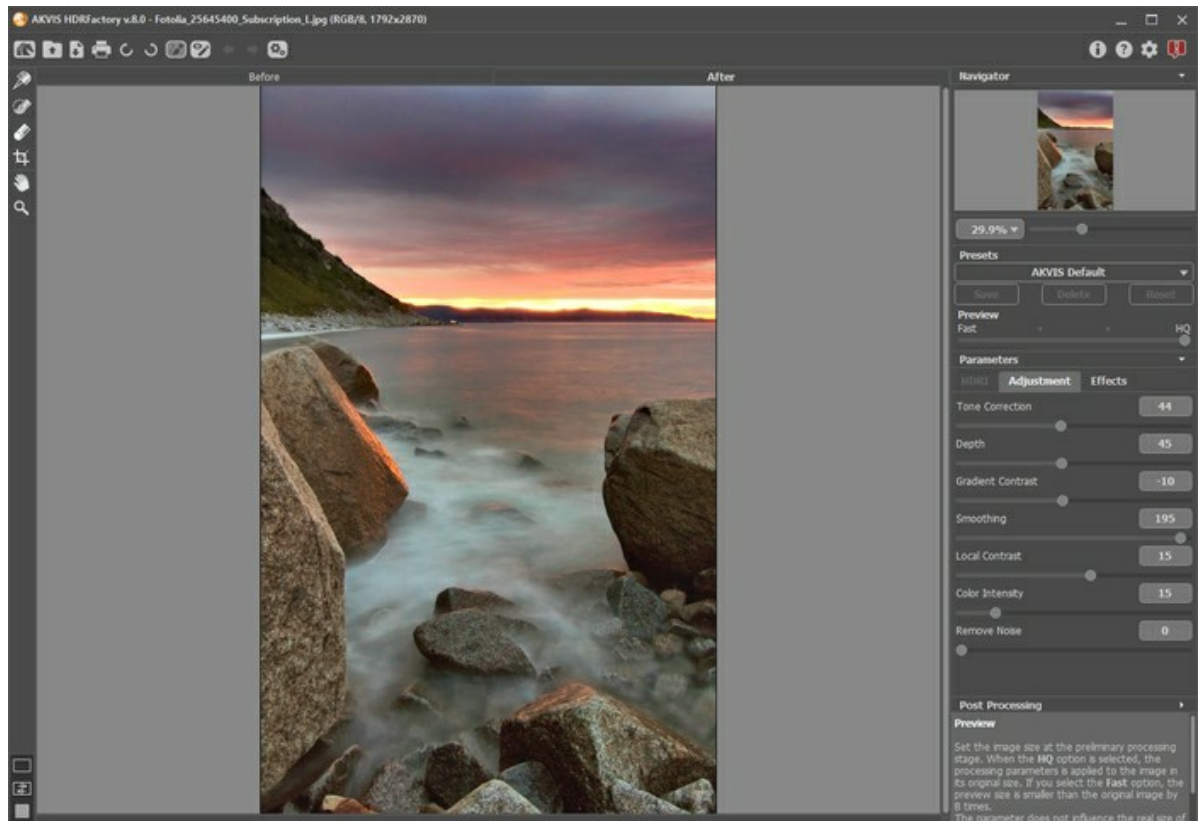

The image now looks better. There are reflections of the sunset on the sea, the sky has began to take on a crimson hue, and some details have become visible. Let's try to achieve an even more brilliant effect.

Step 3. Experiment with the settings: increase the value of **Tone Correction**, **Depth** and **Color Intensity**.

The resulting image is more colorful and realistic. Objects in the image acquired the desired qualities, and colors became brighter and more saturated.

You can save the settings as a preset to use them later with other images.

HIGHLANDS SCENERY: GENERATING AN HDR IMAGE

The photos have been sent to us by **Denis Davydov**.

Denis sent us a series of shots under different exposures. The scenery is really beautiful. However, the colors are dark and some objects are hardly visible because they are not illuminated. Using **AKVIS HDRFactory** you can reveal details and improve color saturation.

Source photos

Result: HDR image

Learn how to achieve this result below:

Step 1. Launch the program **AKVIS HDRFactory**.
Step 2. Press the button [icon] in the Control Panel of **AKVIS HDRFactory** and select the required files.

Images will be loaded into the program and processed automatically using the default parameters (in this case it is the **AKVIS Default** preset).

Step 3. Adjust the **Tone Mapping** settings.

The result is good. You can save the result by pressing the button ![icon] . But our goal is to make this image brighter and reveal some objects in the shadows.

Step 4. We can add volume to the objects by using the **Adjustment** tab.

You can set the values as shown in the screenshot.

Step 5. The image has become too light. We can make it more intense and saturated.

Switch to the **Post Processing** parameters and set **Brightness** = 15, **Saturation** = 40, **Gamma** = 90.

You can compare one of the original images and the result by switching between the **Before** and **After** tabs.

Step 6. We got what we wanted. The resulting image looks great: it's acquired texture, became more intense, and is full of sunshine. Small details and new tints were revealed, and the background is now more voluminous and expressive.

Press the button to save the result.

AKVIS PROGRAMS

AKVIS AirBrush — Airbrushing Techniques on Your Photos

AKVIS AirBrush automatically transforms a photograph into a work of art which looks like made with a special airbrush tool that sprays paints or inks. The software works as an artistic filter creating stylish colorful airbrush designs from images using chosen settings of photo-to-painting conversion. More...

AKVIS Artifact Remover AI — JPEG-Compressed Image Restoration

AKVIS Artifact Remover AI uses artificial intelligence algorithms to remove JPEG compression artifacts and restore the quality of compressed images. This program provides 4 image enhancement modes, each involves a unique neural network developed especially for this occasion. The software is available free of charge for home users. For commercial use, a Business license is offered. More...

AKVIS ArtSuite — Frames and Effects for Your Photos

AKVIS ArtSuite is an impressive collection of versatile frames and effects for photos. ArtSuite contains many templates and texture samples that can be used to create a virtually limitless variety of options for generating frames.
Decorate a photo to give it an original and festive look! More...

AKVIS ArtWork — Collection of Painting & Drawing Techniques

AKVIS ArtWork is photo to painting software designed to imitate different artistic techniques: *Oil Painting*, *Watercolor*, *Gouache*, *Comics*, *Pen & Ink*, *Linocut*, *Stencil*, *Pastel*, and *Pointillism*. ArtWork helps you to create a piece of art out of any picture! More...

AKVIS Chameleon — Photo Collage Creation

AKVIS Chameleon is a fun to use tool for photo collage creation. It makes the process easy and entertaining. The tool is very easy to handle as it does not require precise selection of objects.
Using the software you can quickly create your own photo collages. More...

AKVIS Charcoal — Charcoal & Chalk Drawings

AKVIS Charcoal is a creative tool for conversion of photos into charcoal and chalk drawings. Using the program you can make professional-looking expressive black and white images. Playing with colors and options you can achieve outstanding artistic effects, such as sanguine and others. More...

AKVIS Coloriage AI — Add Color to Black and White Photos

AKVIS Coloriage allows colorizing B&W photos and replacing colors in color images, performing selective colorization and desaturation. It helps to breathe new life into your old family photographs, bring a vintage or artistic appearance to your digital images. More...

AKVIS Decorator — Resurface and Recolor

AKVIS Decorator lets you change the surface of an object in a realistic manner. The program puts on a texture keeping the volume of an object, following its folds and creases. The new pattern looks absolutely natural and makes you see things differently. Recoloring is also made easy. More...

AKVIS Draw — Hand-made Pencil Drawing Effect

AKVIS Draw converts your photos into hand made pencil drawings. The software creates realistic looking line art illustrations, produces both B&W and color drawings. Add a hand-drawn look to your pictures! More...
